DESCRIPTION:

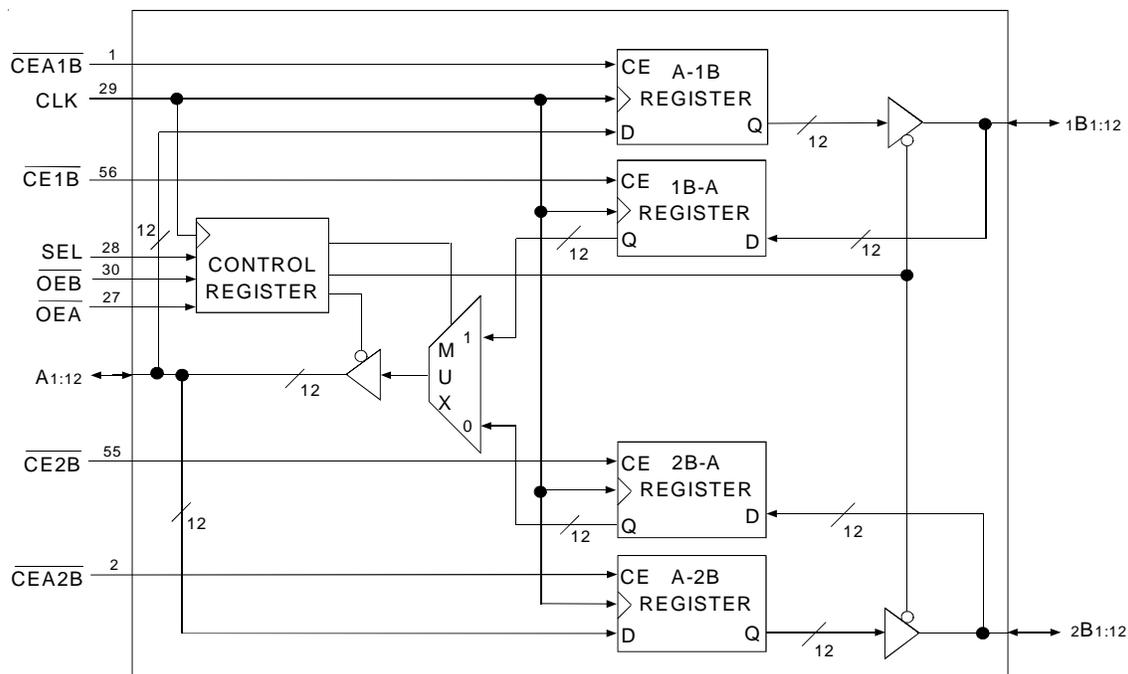

This 12-bit synchronous bus exchanger is built using dual metal CMOS technology. The ALVCH16276 device is a high-speed, bidirectional, 12-bit, registered, bus multiplexer for use in synchronous memory interleaving applications. All registers have a common clock and use a clock enable (CE_{xxx}) on each data register to control data sequencing. The output enables and mux select (\overline{OEA} , \overline{OEB} and SEL) are also under synchronous control allowing direction changes to be edge triggered events.

The ALVCH16276 has three 12-bit ports. Data may be transferred between the A port and either/both of the B ports. The clock enable ($\overline{CE1B}$, $\overline{CE2B}$, $\overline{CEA1B}$ and $\overline{CEA2B}$) inputs control data storage. Both B ports have a common output enable (\overline{OEB}) to aid in synchronously loading the B registers from the B port.

The ALVCH16276 has been designed with a $\pm 24mA$ output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

The ALVCH16276 has "bus-hold" which retains the inputs' last state whenever the input goes to a high impedance. This prevents floating inputs and eliminates the need for pull-up/down resistors.
