

#### 26 GHz, T FLIP-FLOP w/ RESET & PROGRAMMABLE OUTPUT VOLTAGE

#### **Typical Applications**

The HMC679LC3C is ideal for:

- Serial Data Transmission up to 26 Gbps
- High Speed Frequency Divider (up to 26 GHz)
- Broadband Test & Measurement
- RF ATE Applications

#### **General Description**

Features

The HMC679LC3C is a T Flip-Flop w/Reset designed to support clock frequencies as high as 26 GHz. During normal operation, with the reset pin not asserted, the output toggles from its prior state on the positive edge of the clock. This results in a divide-by-two function of the clock input. Asserting the reset pin forces the Q output low regardless of the clock edge state (asynchronous reset assertion). Reversing the clock inputs allows for negative-edge triggered applications. The HMC679LC3C also features an output level control pin, VR, which allows for loss compensation or for signal level optimization.

All input signals to the HMC679LC3C are terminated with 50 $\Omega$  to ground on-chip, and may be either AC or DC coupled. Outputs can be connected directly to a 50 $\Omega$  terminated system, while DC blocking capacitors may be used if the terminating system is 50 $\Omega$  to a non-ground DC voltage. The HMC679LC3C operates from a single -3.3V DC supply and is available in a ceramic RoHS compliant 3x3 mm SMT package.

Reference this number when ordering complete evaluation PCB
Circuit Board Material: Rogers 4350

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. The exposed packaged base should be connected to Vee. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
