

# SPT1175

## 8-BIT, 30 MSPS CMOS A/D CONVERTER

### FEATURES

- 30 MSPS Maximum Conversion Rate
- Internal Sample-and-Hold Function
- 90 mW Power Dissipation at 20 MSPS
- Internal Voltage Reference
- Single +5.0 V Power Supply
- Three-State TTL-Outputs
- TTL/CMOS Compatible

### APPLICATIONS

- Video Digitizing
- Image Scanners
- Personal Computer Video
- Medical Ultrasound
- Multimedia
- Digital Television

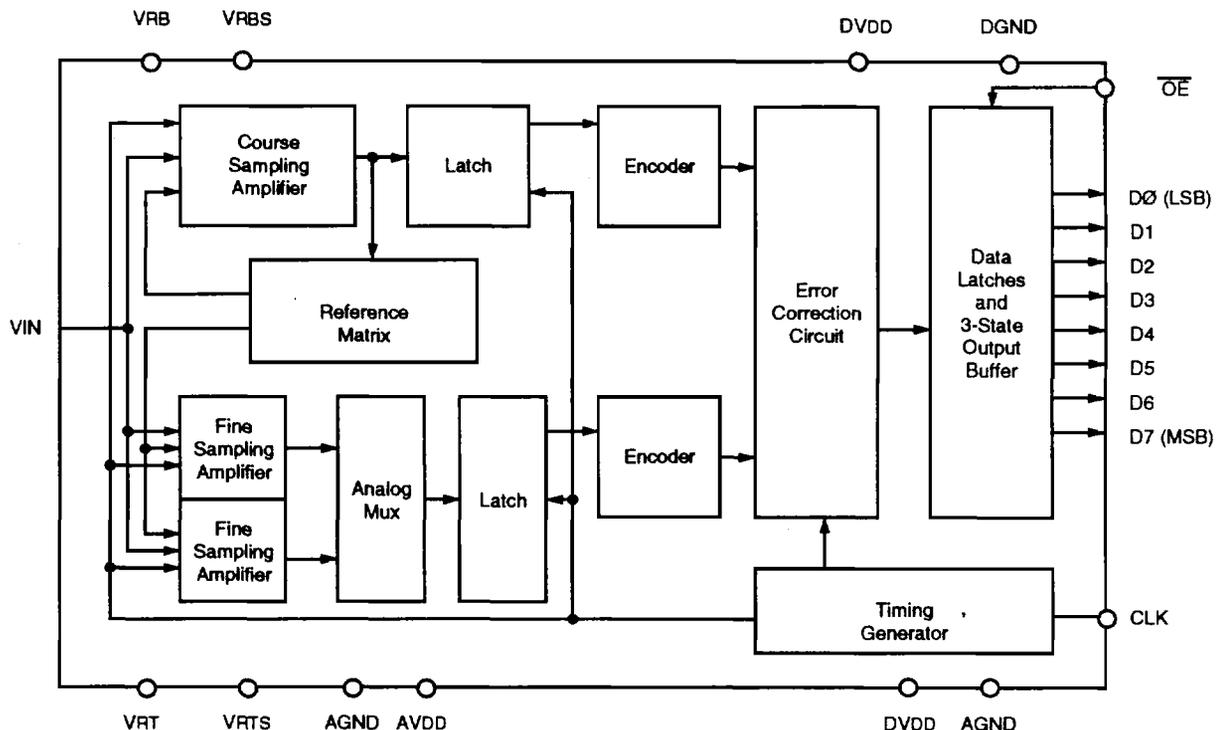

### GENERAL DESCRIPTION

The SPT1175 is a CMOS two-step A/D converter capable of digitizing full scale analog input signals into 8-bit digital words at sample rates of 20 and 30 MSPS.

For most applications, no external sample-and-hold or video driving amplifiers are required due to the device's narrow aperture time, wide bandwidth, and low input capacitance.

The SPT1175 operates from a single +5.0 V power supply and has an internal voltage reference which eliminates the need for external reference circuitry. All digital inputs and tri-state outputs are TTL-compatible. The SPT1175 is ideal for most video and image processing applications that require low power dissipation and low cost. The SPT1175 is available in 24-lead plastic SOIC, plastic DIP, ceramic DIP and die form.

## ABSOLUTE MAXIMUM RATINGS (Beyond which damage may occur)<sup>(1)</sup> 25 °C

### Supply Voltages

$V_{DD}$  ..... -0.5 to +7.0 V

### Input Voltages

Analog Input ..... AGND to  $V_{DD}$

Reference Input Voltage ..... AGND to  $V_{DD}$

ESD Susceptibility<sup>(2)</sup> .....  $\pm 1,500$  V

### Temperature

Operating Temperature ..... -20 to +70 °C

Junction Temperature ..... 175 °C

Lead Temperature, (soldering 10 seconds) ..... 300 °C

Storage Temperature ..... -55 to +125 °C

**Notes:** 1. Operation at any Absolute Maximum Rating is not implied. See Electrical Specifications for proper nominal applied conditions in typical applications.

2. 100 pF discharged through a 1.5 k $\Omega$  resistor (human body model).

## ELECTRICAL SPECIFICATIONS

$T_A = +25$  °C,  $AV_{DD} = DV_{DD} = +5.0$  V, AGND=DGND=0.0 V,  $V_{FB} = +0.6$  V and  $V_{RT} = +2.6$  V, unless otherwise specified.

PARAMETERS	TEST CONDITIONS	TEST LEVEL	MIN	TYP	MAX	UNITS
Resolution			8			Bits
DC Accuracy (+25 °C)						
Integral Nonlinearity		I		$\pm 0.8$	$\pm 1.2$	LSB
Differential Nonlinearity		I		$\pm 0.6$	$\pm 1.0$	LSB
No Missing Codes		I		Guaranteed		
Analog Input						
Input Voltage Range		I	VRB		VRT	V
Input Bias Current		I			$\pm 5.0$	$\mu$ A
Input Resistance		VI	100	200		k $\Omega$
Input Capacitance		V		15		pF
Input Bandwidth		V	12			MHz
Reference Input						
Reference Ladder Resistance		I	200	300	400	$\Omega$
Reference Current		I	5.0	6.7	10.0	mA
Reference Input Voltage	VRB	I	0	0.6	-	V
	VRT	I	-	2.6	2.8	V
Internal Bias	VRB	I	0.55	0.60	0.65	V
	VRT-VRB	I	1.9	2.0	2.1	V
	Short VRT and VRTS					
	Short VRB and VRBS					
Offset Voltage Error						
Top		I	-18	-25	-68	mV
Bottom		I	0	10	40	mV
Timing Characteristics						
Maximum Conversion Rate	1 MHz Input Sine Wave	I	30	40		MSPS
Output Data Delay (td)		IV		18	30	ns
Output Data Delay (Tdish, Tdisl)	(High 'Z')	IV			100	ns
Data Valid Time (Teneh, Tenel)	Tri-state circuit	IV			100	ns
Sampling Time Offset		IV		5	10	ns

NOTE: It is strongly recommended that all of the supply pins ( $AV_{DD}$ ,  $DV_{DD}$ ) be powered from the same source.

## ELECTRICAL SPECIFICATIONS

$T_A = +25\text{ }^\circ\text{C}$ ,  $AV_{DD} = DV_{DD} = +5.0\text{ V}$ ,  $AGND = DGND = 0.0\text{ V}$ ,  $V_{RB} = +0.6\text{ V}$  and  $V_{RT} = +2.6\text{ V}$ , unless otherwise specified.

### TEST LEVEL CODES

### TEST LEVEL

### TEST PROCEDURE

All electrical characteristics are subject to the following conditions:

All parameters having min/max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality Assurance inspection. Any blank section in the data column indicates that the specification is not tested at the specified condition.

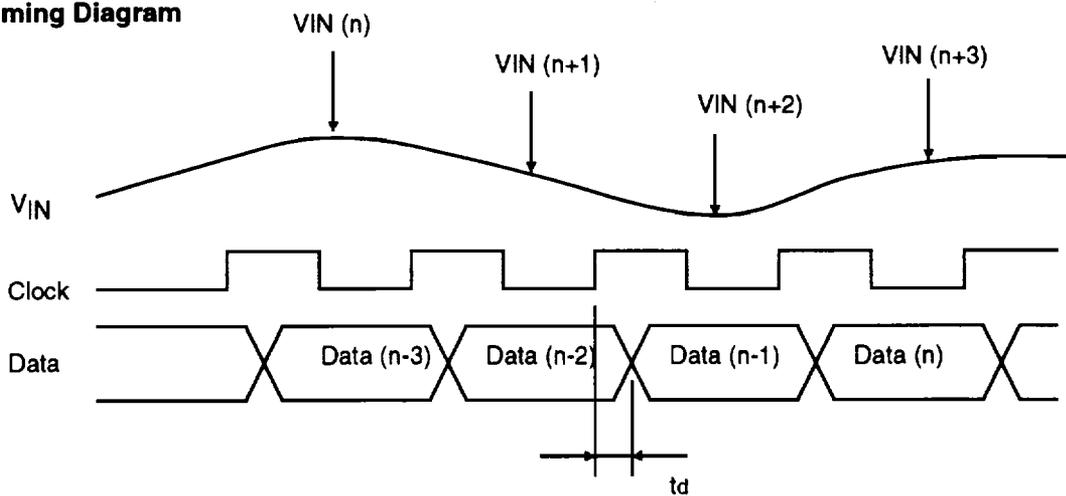

Unless otherwise noted, all tests are pulsed tests; therefore,  $T_J = T_C = T_A$ .

I	100% production tested at the specified temperature.
II	100% production tested at $T_A = 25\text{ }^\circ\text{C}$ , and sample tested at the specified temperatures.
III	QA sample tested only at the specified temperatures.
IV	Parameter is guaranteed (but not tested) by design and characterization data.
V	Parameter is a typical value for information purposes only.
VI	100% production tested at $T_A = 25\text{ }^\circ\text{C}$ . Parameter is guaranteed over specified temperature range.

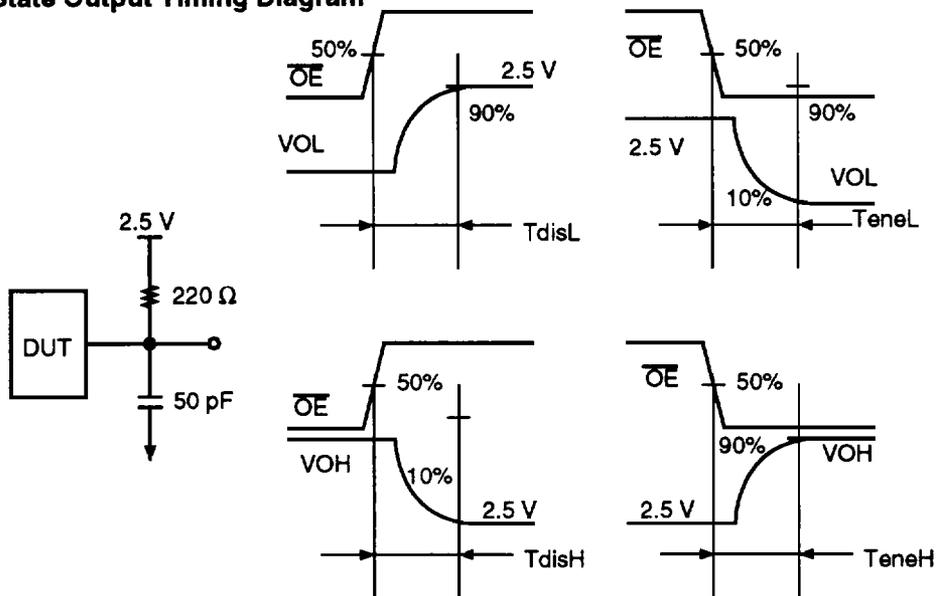

**Table 1 - Output Coding**

INDEX	ANALOG INPUT (V)	DIGITAL OUTPUT
0	0.6078125	00000000
1	0.6078125 ~ 0.6156260	00000001
2	0.6156250 ~ 0.6234375	00000010
....	....	....
123	1.5921875 ~ 1.6000000	01111111
124	1.6000000 ~ 1.6078125	10000000
125	1.6078125 ~ 1.6156250	10000001
....	....	....
254	2.5843750 ~ 2.5921875	11111110
255	2.5921875 ~	11111111

## TYPICAL INTERFACE CIRCUIT

The SPT1175 is an 8-bit analog-to-digital converter which uses a two-step, ping-pong architecture to perform conversions up to 30 MSPS. Figure 2 shows the typical interface requirements when using the SPT1175 in normal operation. The following sections describe the function and operation of the device.

## POWER SUPPLIES AND GROUNDING

The SPT1175 operates from a single +5 V power supply. To reduce noise effects, separate the analog and digital systems close to the device. Each power supply pin should be bypassed as closely as possible to the device. For optimal performance, both the AGND and DGND should be connected to the system's analog ground plane.

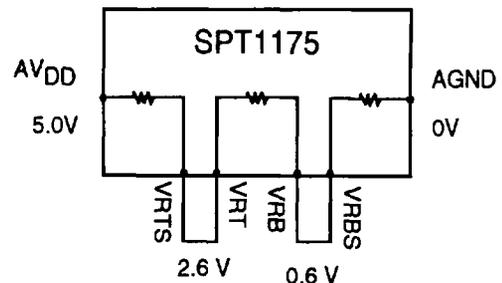

## ANALOG INPUT AND VOLTAGE REFERENCE

The SPT1175 input voltage range is  $V_{RT} > V_{IN} > V_{RB}$ . Two reference voltages (VRT and VRB) are required for device operation. These voltages may be generated externally or the SPT1175's internal reference may be used.

Inside the SPT1175, reference resistors are placed between  $AV_{DD}$  and VRTS and between AGND and VRBS so that VRTS and VRBS generate the 2.6 V and 0.6 V references respectively. (See figure 3.) In order to utilize the internal self-bias reference voltage, VRTS is to be shorted with VRT and the VRBS pin is to be shorted to the VRB pin. The self-bias

internal reference is not as stable over temperature and supply variations as externally generated reference voltages but will perform well in many commercial video applications.

Figure 3 - Reference Circuit Diagram

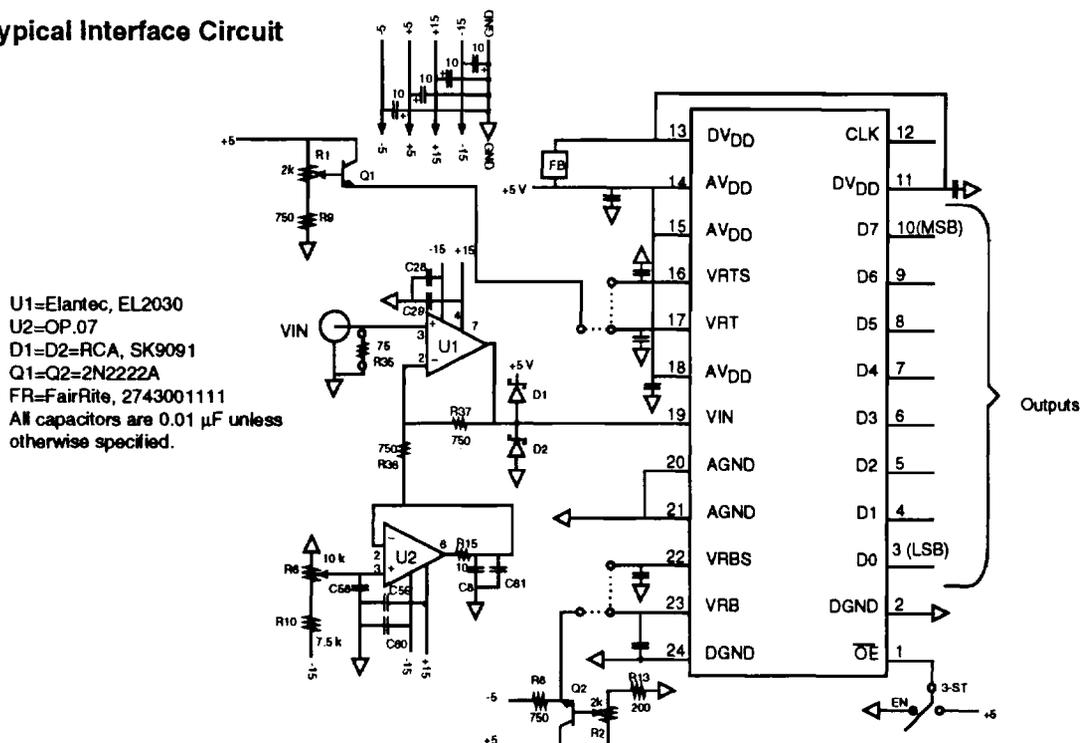

## DIGITAL INPUTS AND OUTPUTS

The analog input is sampled and tracked on the first 'H' cycle of the external clock and is held from the falling edge of CLK. The output remains valid (output hold time), and the new data becomes valid (output delay time) after the rising edge of CLK, delayed by 2.5 clock cycles.

## EVALUATION BOARD

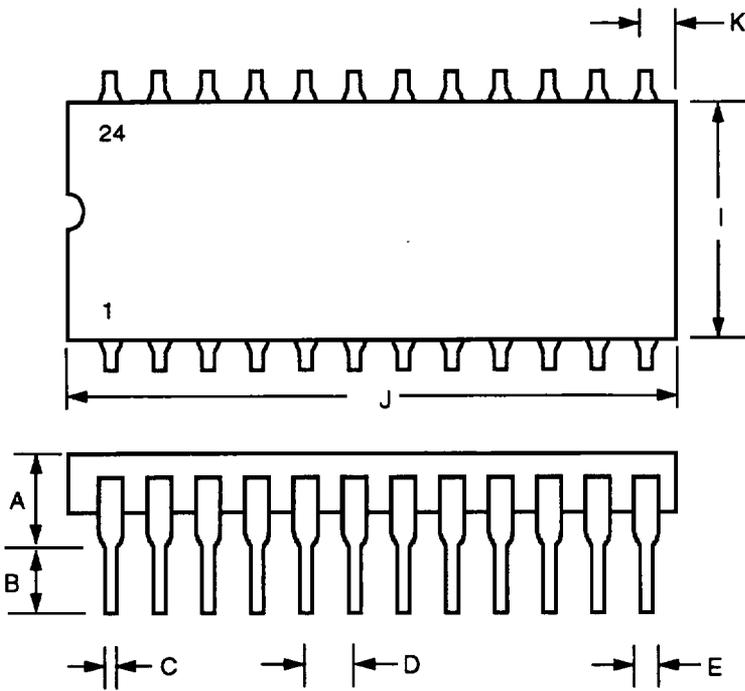

The EB1175 evaluation board is available to aid designers in demonstrating the full performance of the SPT1175. This board includes a reference circuit, clock driver circuit, output data latches, and an on-board reconstruction DAC. An application note describing the operation of the board is available. Contact the factory for price and delivery.
