Functional Description

The CYM1841V33 is a high-performance 3.3V 8-megabit static RAM module organized as 256K words by 32 bits. This mod-

ule is constructed from two 256K x 16 SRAMs in SOJ packages mounted on an epoxy laminate substrate. Four Chip Selects are used to independently enable the four bytes. Reading or writing can be executed on individual bytes or any combination of multiple bytes through proper use of selects.

The CYM1841V33 is designed for use with standard 64-pin ZIP sockets. The pinout is compatible with the 64-pin JEDEC ZIP module family (CYM1821, CYM1831, CYM1836, and CYM1841). Thus, a single motherboard design can be used to accommodate memory depth ranging from 16K words (CYM1821) to 256K words (CYM1841). The CYM1841V33 is offered in a vertical ZIP configuration.

Presence Detect Pins (PD₀–PD₁) are used to identify module memory density in applications where modules with alternate word depths can be interchanged.

Read Cycle No. 1 ^[7, 8]

1841V33-5

Notes:

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- At any given temperature and voltage condition, t_{HZCS} is less than t_{LZCS} for any given device. These parameters are guaranteed and not 100% tested.
- t_{HZCS} and t_{HZWE} are specified with $C_L = 5$ pF as in part (b) of AC Test Loads and Waveforms. Transition is measured ± 500 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of $\overline{CS}$ LOW and $\overline{WE}$ LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- $\overline{WE}$ is HIGH for read cycle.
- Device is continuously selected, $\overline{CS} = V_{IL}$, and $\overline{OE} = V_{IL}$.
