

# Agilent ATF-551M4 Low Noise Enhancement Mode Pseudomorphic HEMT in a Miniature Leadless Package

## Data Sheet

### Description

Agilent Technologies' ATF-551M4 is a high dynamic range, super low noise, single supply E-pHEMT GAAs FET housed in a thin miniature leadless package.

The combination of small device size, super low noise (under 1 dB Fmin from 2 to 6 GHz), high linearity and low power makes the ATF-551M4 ideal for LNA or hybrid module designs in wireless receiver in the 450 MHz to 10 GHz frequency band.

Applications include Cellular/PCS/ WCDMA handsets and data modem cards, fixed wireless infrastructure in the 2.4, 3.5 GHz and UNII frequency bands, as well as 2.4 GHz 802.11b, 5 GHz 802.11a and HIPERLAN/2 Wireless LAN PC-cards.

### Note:

1. Agilent's enhancement mode E-pHEMT devices are the first commercially available single-supply GaAs transistors that do not need a negative gate bias voltage for operation. They can help simplify the design and reduce the cost of receivers and transmitters in many applications in the 450 MHz to 10 GHz frequency range.

### MiniPak 1.4 mm x 1.2 mm Package

### Pin Connections and Package Marking

### Note:

Top View. Package marking provides orientation, product identification and date code.

"V" = Device Type Code

"x" = Date code character. A different character is assigned for each month and year.

### Features

- Very low noise figure and high linearity
- Single Supply Enhancement Mode Technology<sup>(1)</sup> optimized for 3V operation
- Excellent uniformity in product specifications
- 400 micron gate width
- Thin miniature package 1.4 mm x 1.2 mm x 0.7 mm
- Tape-and-reel packaging option available

### Specifications

- 2 GHz; 2.7V, 10 mA (typ.)
- 24.1 dBm output 3<sup>rd</sup> order intercept
- 14.6 dBm output power at 1 dB gain compression
- 0.5 dB noise figure
- 17.5 dB associated gain

### Applications

- Low Noise Amplifier for:
  - Cellular/PCS/WCDMA handsets and modem cards
  - 2.4 GHz, 3.5 GHz and UNII fixed wireless infrastructure
  - 2.4 GHz 802.11b Wireless LAN
  - 5 GHz 802.11a and HIPERLAN Wireless LAN
- General purpose discrete E-pHEMT for other ultra low noise applications

Agilent Technologies

## ATF-551M4 Absolute Maximum Ratings<sup>[1]</sup>

Symbol	Parameter	Units	Absolute Maximum
$V_{DS}$	Drain-Source Voltage <sup>[2]</sup>	V	5
$V_{GS}$	Gate-Source Voltage <sup>[2]</sup>	V	-5 to +1
$V_{GD}$	Gate Drain Voltage <sup>[2]</sup>	V	-5 to +1
$I_{DS}$	Drain Current <sup>[2]</sup>	mA	100
$I_{GS}$	Gate Current <sup>[5]</sup>	mA	1
$P_{diss}$	Total Power Dissipation <sup>[3]</sup>	mW	270
$P_{in,max}$	RF Input Power	dBm	10
$T_{CH}$	Channel Temperature	°C	150
$T_{STG}$	Storage Temperature	°C	-65 to 150
$\theta_{jc}$	Thermal Resistance <sup>[4]</sup>	°C/W	240

### Notes:

1. Operation of this device above any one of these parameters may cause permanent damage.
2. Assumes DC quiescent conditions.
3. Source lead temperature is 25°C. Derate 6 mW/°C for  $T_L > 40^\circ\text{C}$ .
4. Thermal resistance measured using 150°C Liquid Crystal Measurement method.
5. Device can safely handle +10 dBm RF Input Power provided  $I_{GS}$  is limited to 1 mA.  $I_{GS}$  at  $P_{1dB}$  drive RF level is bias circuit dependent. See applications section for additional information.

Figure 1. Typical I-V Curves.  
( $V_{GS} = 0.1\text{ V per step}$ )

## Product Consistency Distribution Charts<sup>[6]</sup>

Figure 2. Capability Plot for Gain @ 2.7 V,  
10 mA. LSL = 15.5, Nominal = 17.5,  
USL = 18.5

Figure 3. Capability Plot for OIP3 @ 2.7 V,  
10 mA. LSL = 22.0, Nominal = 24.1

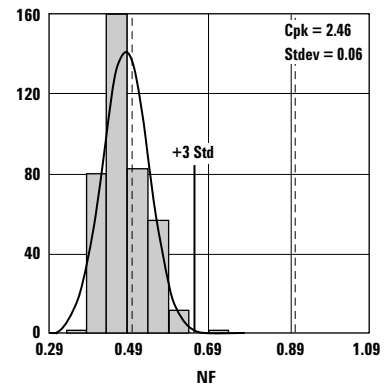

Figure 4. Capability Plot for NF @ 2.7 V,  
10 mA. Nominal = 0.5, USL = 0.9

### Note:

6. Distribution data sample size is 398 samples taken from 4 different wafers. Future wafers allocated to this product may have nominal values anywhere between the upper and lower limits. Measurements made on production test board. This circuit represents a trade-off between an optimal noise match and a realizable match based on production test equipment. Circuit losses have been de-embedded from actual measurements.

## ATF-551M4 Electrical Specifications

$T_A = 25^\circ\text{C}$ , RF parameters measured in a test circuit for a typical device

Symbol	Parameter and Test Condition		Units	Min.	Typ.	Max.

		$f = 3.9\text{ GHz}$	$V_{ds} = 2.7\text{V}, I_{ds} = 10\text{ mA}$	dBm	—	24.3	—
		$f = 5.8\text{ GHz}$	$V_{ds} = 2.7\text{V}, I_{ds} = 10\text{ mA}$	dBm	—	24.5	—
P1dB	1dB Compressed Output Power <sup>[3]</sup>	$f = 900\text{ GHz}$	$V_{ds} = 2.7\text{V}, I_{ds} = 10\text{ mA}$	dBm	—	14.3	—
		$f = 3.9\text{ GHz}$	$V_{ds} = 2.7\text{V}, I_{ds} = 10\text{ mA}$	dBm	—	14.5	—
		$f = 5.8\text{ GHz}$	$V_{ds} = 2.7\text{V}, I_{ds} = 10\text{ mA}$	dBm	—	14.3	—

### Notes:

- The Fmin values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements Fmin is calculated. Refer to the noise parameter measurement section for more information.
- Measurements taken above and below 2 GHz was made using a double stub tuner at the input tuned for low noise and a double stub tuner at the output tuned for maximum OIP3. Circuit losses have been de-embedded from actual measurements.

**Figure 27. MSG/MAG and  $|S_{21}|^2$  vs. Frequency at 2V, 15 mA.**

**Notes:**

1. The  $F_{min}$  values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements  $F_{min}$  is calculated. Refer to the noise parameter measurement section for more information.
2. S and noise parameters are measured on a microstrip line made on 0.010 inch thick alumina carrier assembly. The input reference plane is at the end of the gate pad. The output reference plane is at the end of the drain pad.

**Notes:**

1. The  $F_{min}$  values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements  $F_{min}$  is calculated. Refer to the noise parameter measurement section for more information.
2. S and noise parameters are measured on a microstrip line made on 0.010 inch thick alumina carrier assembly. The input reference plane is at the end of the gate pad. The output reference plane is at the end of the drain pad.

**Figure 35. MSG/MAG and  $|S_{21}|^2$  vs. Frequency at 3V, 30 mA.**

**Notes:**

1. The  $F_{min}$  values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements  $F_{min}$  is calculated. Refer to the noise parameter measurement section for more information.
2. S and noise parameters are measured on a microstrip line made on 0.010 inch thick alumina carrier assembly. The input reference plane is at the end of the gate pad. The output reference plane is at the end of the drain pad.

### S and Noise Parameter Measurements

The position of the reference planes used for the measurement of both S and Noise Parameter measurements is shown in Figure 36. The reference plane can be described as being at the center of both the gate and drain pads.

S and noise parameters are measured with a 50 ohm microstrip test fixture made with a 0.010" thickness aluminum substrate. Both source pads are connected directly to ground via a 0.010" thickness metal rib which provides a very low inductance path to ground for both source pads. The inductance associated with the addition of printed circuit board plated through holes and source bypass capacitors must be added to the computer circuit simulation to properly model the effect of grounding the source leads in a typical amplifier design.

Figure 36. Position of the Reference Planes.

### Noise Parameter Applications Information

The  $F_{min}$  values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements, a true  $F_{min}$  is calculated.  $F_{min}$  represents the true minimum noise figure of the device when the device is presented with an impedance matching network that transforms the source impedance, typically  $50\Omega$ , to an impedance represented by the reflection coefficient  $\Gamma_o$ . The designer must design a matching network that will present  $\Gamma_o$  to the device with minimal associated circuit losses. The noise figure of the completed amplifier is equal to the noise figure of the device plus the losses of the matching network preceding the device. The noise figure of the device is equal to  $F_{min}$  only when the device is presented with  $\Gamma_o$ . If the reflection coefficient of the matching network is other than  $\Gamma_o$ , then the noise figure of the device will be greater than  $F_{min}$  based on the following equation.

$$NF = F_{min} + 4 R_n \frac{|\Gamma_s - \Gamma_o|^2}{Z_o (1 + |\Gamma_o|^2) (1 - |\Gamma_s|^2)}$$

Where  $R_n/Z_o$  is the normalized noise resistance,  $\Gamma_o$  is the optimum reflection coefficient required to produce  $F_{min}$  and  $\Gamma_s$  is the reflection coefficient of the source impedance actually presented to the device.

The losses of the matching networks are non-zero and they will also add to the noise figure of the device creating a higher amplifier noise figure. The losses of the matching networks are related to the Q of the components and associated printed circuit board loss.  $\Gamma_o$  is typically fairly low at higher frequencies and increases as frequency is lowered. Larger gate width devices will typically have a lower  $\Gamma_o$  as compared to narrower gate width devices. Typically for FETs, the higher  $\Gamma_o$  usually infers that an impedance much higher than  $50\Omega$  is required for the device to produce  $F_{min}$ . At VHF frequencies and even lower L Band frequencies, the required impedance can be in the vicinity of several thousand ohms. Matching to such a high impedance requires very hi-Q components in order to minimize circuit losses. As an example at 900 MHz, when air wound coils ( $Q > 100$ ) are used for matching networks, the loss can still be up to 0.25 dB which will add directly to the noise figure of the device. Using multilayer molded inductors with Qs in the 30 to 50 range results in additional loss over the air wound coil. Losses as high as 0.5 dB or greater add to the typical 0.15 dB  $F_{min}$  of the device creating an amplifier noise figure of nearly 0.65 dB.

## ATF-551M4 Applications Information

### Introduction

Agilent Technologies's ATF-551M4 is a low noise enhancement mode PHEMT designed for use in low cost commercial applications in the VHF through 10 GHz frequency range. As opposed to a typical depletion mode PHEMT where the gate must be made negative with respect to the source for proper operation, an enhancement mode PHEMT requires that the gate be made more positive than the source for normal operation. Therefore a negative power supply voltage is not required for an enhancement mode device. Biasing an enhancement mode PHEMT is much like biasing the typical bipolar junction transistor. Instead of a 0.7V base to emitter voltage, the ATF-551M4 enhancement mode PHEMT requires a nominal 0.47V potential between the gate and source for a nominal drain current of 10 mA.

### Matching Networks

The techniques for impedance matching an enhancement mode device are very similar to those for matching a depletion mode device. The only difference is in the method of supplying gate bias. S and Noise Parameters for various bias conditions are listed in this data sheet. The circuit shown in Figure 1 shows a typical LNA circuit normally used for 900 and 1900 MHz applications. Consult the Agilent Technologies web site for application notes covering specific designs and applications. High pass impedance matching networks consisting of L1/C1 and L4/C4 provide the appropriate match for noise figure, gain, S11 and S22. The high pass structure also provides low frequency gain reduction which can be beneficial

from the standpoint of improving out-of-band rejection.

Capacitors C2 and C5 provide a low impedance in-band RF bypass for the matching networks. Resistors R3 and R4 provide a very important low frequency termination for the device. The resistive termination improves low frequency stability. Capacitors C3 and C6 provide the RF bypass for resistors R3 and R4. Their value should be chosen carefully as C3 and C6 also provide a termination for low frequency mixing products. These mixing products are as a result of two or more in-band signals mixing and producing third order in-band distortion products. The low frequency or difference mixing products are terminated by C3 and C6. For best suppression of third order distortion products based on the CDMA 1.25 MHz signal spacing, C3 and C6 should be 0.1  $\mu$ F in value. Smaller values of capacitance will not suppress the generation of the 1.25 MHz difference signal and as a result will show up as poorer two tone IP3 results.

Figure 1. Typical ATF-551M4 LNA with Passive Biasing.

### Bias Networks

One of the major advantages of the enhancement mode technology is that it allows the designer to be able to dc ground the source leads and then merely

apply a positive voltage on the gate to set the desired amount of quiescent drain current  $I_d$ .

Whereas a depletion mode PHEMT pulls maximum drain current when  $V_{gs} = 0V$ , an enhancement mode PHEMT pulls only a small amount of leakage current when  $V_{gs} = 0V$ . Only when  $V_{gs}$  is increased above  $V_{th}$ , the device threshold voltage, will drain current start to flow. At a  $V_{ds}$  of 2.7V and a nominal  $V_{gs}$  of 0.47V, the drain current  $I_d$  will be approximately 10 mA. The data sheet suggests a minimum and maximum  $V_{gs}$  over which the desired amount of drain current will be achieved. It is also important to note that if the gate terminal is left open circuited, the device will pull some amount of drain current due to leakage current creating a voltage differential between the gate and source terminals.

### Passive Biasing

Passive biasing of the ATF-551M4 is accomplished by the use of a voltage divider consisting of R1 and R2. The voltage for the divider is derived from the drain voltage which provides a form of voltage feedback through the use of R3 to help keep drain current constant. In the case of a typical depletion mode FET, the voltage divider which is normally connected to a negative voltage source is connected to the gate through resistor R4. Additional resistance in the form of R5 (approximately 10K $\Omega$ ) is added to provide current limiting for the gate of enhancement mode devices such as the ATF-551M4. This is especially important when the device is driven to P1dB or Psat.

Resistor R3 is calculated based on desired  $V_{ds}$ ,  $I_{ds}$  and available power supply voltage.

$$R3 = \frac{V_{DD} - V_{ds}}{I_{ds} + I_{BB}} \quad (1)$$

$V_{DD}$  is the power supply voltage.  
 $V_{ds}$  is the device drain to source voltage.

$I_{ds}$  is the desired drain current.  
 $I_{BB}$  is the current flowing through the R1/R2 resistor voltage divider network.

The value of resistors R1 and R2 are calculated with the following formulas.

$$R1 = \frac{V_{gs}}{I_{BB}} \quad (2)$$

$$R2 = \frac{(V_{ds} - V_{gs}) R1}{V_{gs}} \quad (3)$$

#### Example Circuit

$$\begin{aligned} V_{DD} &= 3V \\ V_{ds} &= 2.7V \\ I_{ds} &= 10 \text{ mA} \\ V_{gs} &= 0.47V \end{aligned}$$

Choose  $I_{BB}$  to be at least 10X the maximum expected gate leakage current.  $I_{BB}$  was conservatively chosen to be 0.5 mA for this example. Using equations (1), (2), and (3) the resistors are calculated as follows

$$\begin{aligned} R1 &= 940\Omega \\ R2 &= 4460\Omega \\ R3 &= 28.6\Omega \end{aligned}$$

#### Active Biasing

Active biasing provides a means of keeping the quiescent bias point constant over temperature and constant over lot to lot variations in device dc performance. The advantage of the active biasing of an enhancement mode PHEMT versus a depletion mode PHEMT is that a negative power source is not required. The techniques of active biasing an enhancement mode device are very similar to those used to bias a bipolar junction transistor.

An active bias scheme is shown in Figure 2.

Figure 2. Typical ATF-551M4 LNA with Active Biasing.

R1 and R2 provide a constant voltage source at the base of a PNP transistor at Q2. The constant voltage at the base of Q2 is raised by 0.7 volts at the emitter. The constant emitter voltage plus the regulated  $V_{DD}$  supply are present across resistor R3. Constant voltage across R3 provides a constant current supply for the drain current. Resistors R1 and R2 are used to set the desired  $V_{ds}$ . The combined series value of these resistors also sets the amount of extra current consumed by the bias network. The equations that describe the circuit's operation are as follows.

$$V_E = V_{ds} + (I_{ds} \cdot R4) \quad (1)$$

$$R3 = \frac{V_{DD} - V_E}{I_{ds}} \quad (2)$$

$$V_B = V_E - V_{BE} \quad (3)$$

$$V_B = \frac{R1}{R1 + R2} V_{DD} \quad (4)$$

$$V_{DD} = I_{BB} (R1 + R2) \quad (5)$$

Rearranging equation (4) provides the following formula

$$R2 = \frac{R1 (V_{DD} - V_B)}{V_B} \quad (4A)$$

and rearranging equation (5) provides the follow formula

$$R1 = \frac{V_{DD}}{I_{BB} \left(1 + \frac{V_{DD} - V_B}{V_B}\right)} \quad (5A)$$

#### Example Circuit

$$\begin{aligned} V_{DD} &= 3V \\ V_{ds} &= 2.7V \\ I_{ds} &= 10 \text{ mA} \\ R4 &= 10\Omega \\ V_{BE} &= 0.7V \end{aligned}$$

Equation (1) calculates the required voltage at the emitter of the PNP transistor based on desired  $V_{ds}$  and  $I_{ds}$  through resistor R4 to be 2.8V. Equation (2) calculates the value of resistor R3 which determines the drain current  $I_{ds}$ . In the example  $R3=18.2\Omega$ . Equation (3) calculates the voltage required at the junction of resistors R1 and R2. This voltage plus the step-up of the base emitter junction determines the regulated  $V_{ds}$ . Equations (4) and (5) are solved simultaneously to determine the value of resistors R1 and R2. In the example  $R1=4200\Omega$  and  $R2 =1800\Omega$ .

R7 is chosen to be 1 k $\Omega$ . This resistor keeps a small amount of current flowing through Q2 to help maintain bias stability. R6 is chosen to be 10 K $\Omega$ . This value of resistance is high enough to limit Q1 gate current in the presence of high RF drive levels as experienced when Q1 is driven to the P1dB gain compression point. C7 provides a low frequency bypass to keep noise from Q2 effecting the operation of Q1. C7 is typically 0.1  $\mu$ F.

#### Maximum Suggested Gate Current

The maximum suggested gate current for the ATF-551M4 is 1 mA. Incorporating resistor R5 in the passive bias network or resistor R6 in the active bias network safely limits gate current to 500  $\mu$ A at P1dB drive levels. In order to minimize component count in the passive biased amplifier circuit, the 3 resistor bias circuit consisting of R1, R2, and R5 can be simplified if desired. R5 can be removed if R1 is replaced with a 5.6K $\Omega$  resistor

and if R2 is replaced with a 27KΩ resistor. This combination should limit gate current to a safe level.

### PCB Layout

A suggested PCB pad print for the miniature, Minipak 1412 package used by the ATF-551M4 is shown in Figure 3.

Figure 3. PCB Pad Print for Minipak 1412. Package (mm [inches]).

This pad print provides allowance for package placement by automated assembly equipment without adding excessive parasitics that could impair the high frequency performance of the ATF-551M4. The layout is shown with a footprint of the ATF-551M4 superimposed on the PCB pads for reference.

### For Further Information

The information presented here is an introduction to the use of the ATF-551M4 enhancement mode PHEMT. More detailed application circuit information is available from Agilent Technologies. Consult the web page or your local Agilent Technologies sales representative.

### ATF-551M4 Minipak Model

## Ordering Information

Part Number	No. of Devices	Container
ATF-551M4-TR1	3000	7" Reel
ATF-551M4-TR2	10,000	13" Reel
ATF-551M4-BLK	100	antistatic bag

## MiniPak Package Outline Drawing

## Solder Pad Dimensions

Dimensions are in millimetres (inches)

## Device Orientation for Outline 4T, MiniPak 1412

Note: Vx represents Package Marking Code.  
Device orientation is indicated by package marking.

## Tape Dimensions

	DESCRIPTION	SYMBOL	SIZE (mm)	SIZE (INCHES)
CAVITY	LENGTH	A <sub>0</sub>	1.40 ± 0.05	0.055 ± 0.002
	WIDTH	B <sub>0</sub>	1.53 ± 0.05	0.064 ± 0.002
	DEPTH	K <sub>0</sub>	0.80 ± 0.05	0.031 ± 0.002
	PITCH	P	4.00 ± 0.10	0.157 ± 0.004
	BOTTOM HOLE DIAMETER	D <sub>1</sub>	0.80 ± 0.05	0.031 ± 0.002
	PERFORATION	DIAMETER	D	1.50 ± 0.10
PITCH		P <sub>0</sub>	4.00 ± 0.10	0.157 ± 0.004
POSITION		E	1.75 ± 0.10	0.069 ± 0.004
CARRIER TAPE	WIDTH	W	8.00 + 0.30 - 0.10	0.315 + 0.012 - 0.004
	THICKNESS	t <sub>1</sub>	0.254 ± 0.02	0.010 ± 0.0008
COVER TAPE	WIDTH	C	5.40 ± 0.10	0.213 ± 0.004
	TAPE THICKNESS	T <sub>t</sub>	0.062 ± 0.001	0.0024 ± 0.00004
DISTANCE	CAVITY TO PERFORATION (WIDTH DIRECTION)	F	3.50 ± 0.05	0.138 ± 0.002
	CAVITY TO PERFORATION (LENGTH DIRECTION)	P <sub>2</sub>	2.00 ± 0.05	0.079 ± 0.002
