NOTES:

1. The writing occurs during the overlap (t_{WP}) of $\overline{CE}_1 = \text{"LOW"}$, $CE_2 = \text{"HIGH"}$, and $\overline{WE} = \text{"LOW"}$.
2. t_{CW} is defined as the time from the last occurring transition, either $\overline{CE}_1$ LOW transition or CE_2 HIGH transition, to the time when the writing is finished.
3. t_{AS} is defined as the time from address change to writing start.
4. t_{WR} is defined as the time from writing finish to address change.
5. If $\overline{CE}_1$ LOW transition or CE_2 HIGH transition occurs at the same time or after $\overline{WE}$ LOW transition, the output will remain high-impedance.
6. If $\overline{CE}_1$ HIGH transition or CE_2 LOW transition occurs at the same time or before $\overline{WE}$ HIGH transition, the output will remain high-impedance.
7. While the I/O pins are in the output state, input signals with the opposite logic level must not be applied.
