100125

Hex ECL-to-TTL Translator

FEATURES

- Typical propagation delay: 2.2ns
- Typical ECL supply current ($-I_{EE}$): 65mA
- Typical TTL supply current (I_{TTL}): 75mA

DESCRIPTION

The 100125 is a hex translator that converts ECL logic levels to TTL logic levels. Differential inputs allow each circuit to be used as an inverting, non-inverting, or differential receiver. An internal reference voltage generator provides V_{BB} for single-ended operation or for use in Schmitt trigger applications.

When used in the differential mode, common mode rejection makes this device tolerant of ground offsets and transients between the signal source and the

translator. The 100125 outputs are designed to go to a low logic level whenever both inputs are left open or tied to V_{EE} . The V_{EE} and V_{TTL} power may be applied in any order. All unused inputs can be left open due to integrated pull-down resistors.

PIN DESCRIPTION

PINS	DESCRIPTION
$D_0 - D_5$	True data Inputs (100K ECL compatible)
$\bar{D}_0 - \bar{D}_5$	Complementary data inputs (100K ECL compatible)
V_{BB}	Reference voltage output (100K ECL compatible)
$Q_0 - Q_5$	Data outputs (TTL compatible)

ABSOLUTE MAXIMUM RATINGS GND = ground, $T_A = 0^\circ\text{C}$ to $+85^\circ\text{C}$ unless otherwise specified.

SYMBOL	PARAMETER	LIMITS	UNIT
V_{EE}	ECL Supply voltage range	-7.0 to +0.5	V
V_{IN}	Input voltage (V_{IN} should never be more negative than V_{EE})	V_{EE} to +0.5	V
V_{TTL}	Output source current (continuous)	-0.5V to +7.0	V
V_{OUT}	Voltage applied to output in high state	-0.5V to V_{TTL}	V
I_O	Output source (continuous)	-40	mA
T_S	Storage temperature range	-65 to +150	$^\circ\text{C}$
T_J	Maximum junction temperature	+150	$^\circ\text{C}$

NOTE:

Operation beyond the limits set forth in this table may impair the useful life of the device.

DC OPERATING CONDITIONS

SYMBOL	PARAMETER	TEST CONDITIONS	LIMITS			UNIT
			MIN.	NOM.	MAX.	
GND	Circuit ground		0	0	0	V
V_{TTL}	TTL supply voltage		+4.5	+5.0	+5.5	V
V_{EE}	ECL supply voltage		-4.8	-4.5	-4.2	V
V_{EE}	ECL supply voltage when operating with the 10K or the 10KH ECL family.		-5.7			V
V_{IH}^2	High level input voltage	$V_{EE} = -4.2\text{V}$	-1150		-880	mV
		$V_{EE} = -4.5\text{V}$	-1165			
		$V_{EE} = -4.8\text{V}$	-1165			
V_{IL}^2	Low level input voltage	$V_{EE} = -4.2\text{V}$	-1810		-1475	mV
		$V_{EE} = -4.5\text{V}$			-1475	mV
		$V_{EE} = -4.8\text{V}$			-1490	mV
V_{CM}^3	Common mode voltage	$V_{EE} = -4.2\text{V}$	0		1.0	V
		$V_{EE} = -4.5\text{V}$				
		$V_{EE} = -4.8\text{V}$				
V_{DIFF}^4	Differential input voltage	$V_{EE} = -4.2\text{V}$	150			V
		$V_{EE} = -4.5\text{V}$				
		$V_{EE} = -4.8\text{V}$				
$-I_{OH}$	High level output current				2.0	mA
I_{OL}	Low level output current				20	mA
T_A	Operating ambient temperature range		0	+25	+85	$^\circ\text{C}$

NOTES:

- When operating at other than the specified V_{EE} voltages (-4.2V, -4.5V, -4.8V), the DC and AC electrical characteristics will vary slightly from their specified values.
- For input voltages outside the specified V_{IH} and V_{IL} ranges, the output voltage specifications will hold true. However, the AC performance will be according to specification only if two conditions are met: First, D_n or \bar{D}_n must be above -2300mV at all times. Second, both D_n and \bar{D}_n must be below -230mV.
- V_{CM} is added or subtracted with respect to V_{BB} . For common-mode applications, the total voltage applied to D_n or \bar{D}_n should be no less than $V_{BB} - V_{CM}(\text{max})$ and no greater than $V_{BB} + V_{CM}(\text{max})$.
- $V_{DIFF}(\text{min})$ is the minimum voltage difference by which D_n must exceed \bar{D}_n such that the output Q_n will assume a defined logic level (Low or High).

I_{IL}	Low level Input current	One D_n input under test at V_{ILMIN} , all other D_n inputs at V_{IHMAX} . All \bar{D}_n inputs connected to V_{BB} pin.	0.5			μA	
$-I_{EE}$	V_{EE} supply current	All D_n at V_{IHMAX} . All \bar{D}_n at V_{BB} .	40	65	85	mA	
$-I_{OS}$	Short circuit current ⁴	All D_n connected to V_{BB} pin. All \bar{D}_n inputs at V_{ILMIN} . One Q_n under test at ground. $V_{TTL} = 5.5\text{V}$.	-40		100	mA	
I_{TTLH}	V_{TTL} supply current outputs High	All D_n connected to V_{BB} pin. All \bar{D}_n inputs at V_{ILMIN} . $V_{TTL} = 5.5\text{V}$.		70	100	mA	
I_{TTL}	V_{TTL} supply current outputs Low	All D_n connected to V_{BB} pin. All \bar{D}_n inputs at V_{IHMAX} . $V_{TTL} = 5.5\text{V}$.		80	115	mA	

NOTES:

- The specified limits represent the worst case values for the parameter. Since these worst case values normally occur at the supply voltage and temperature extremes, additional noise immunity can be achieved by decreasing the allowable operating condition ranges.
- Conditions for testing shown in the tables are not necessarily worst case. For worst case testing guidelines, refer to DC Testing, Chapter 1, Section 3.
- The specified limits shown in the DC electrical characteristics table can be met only after thermal equilibrium has been established. Thermal equilibrium is established by applying power for at least 2 minutes, while maintaining transverse airflow of 2.5 meters/sec (500 linear feet/min) over the device, mounted either in a test socket or on a printed circuit board. Test voltage values are given in the DC operating conditions table.
- Not more than one output should be shorted at a time. The other outputs should not be loaded. For testing I_{OS} , the use of a high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
