## MITSUBISHI DIGITAL TV ICs

# M65664SP/FP

PICTURE-IN-PICTURE  
SIGNAL PROCESSING

### V2.0

### DESCRIPTION

The M65664SP/FP is a PIP (Picture in Picture) signal processing LSI, whose sub-picture input is composite signal for NTSC, PAL-M, and PAL-N. The built-in field memory (168k-bit RAM) , V-chip data slicer and analog circuitries lead the high quality PIP system low cost and small size.

### FEATURES

- \* Internal V-chip data slicer (for sub-picture)
- \* Vertical filter for sub-picture ( Y signal )
- \* Single sub-picture ( selectable picture size : 1/9 , 1/16 )
- \* Sub-picture processing specification ( 1/9 , 1/16 size ) :
  - Quantization bits Y, B-Y, R-Y : 7 bits
  - Horizontal sampling 229 pixels (Y), 57 pixels (B-Y, R-Y)
  - Vertical lines 69/ 52 lines
- \* Frame ( sub-picture ) on/off
- \* Built-in analog circuits :
  - One 8-bit A/D converter (for sub-picture signal)
  - Three 8-bit D/A converters (for Y, U and V of sub-picture)
  - Sync-tip-clamp, VCXO ... etc..
- \* IIC BUS control ( parallel/serial control ) :
  - PIP on/off , Frame on/off ( programmable luma level),
  - Sub-picture size ( 1/9, 1/16 ),
  - PIP position ( free position ), Picture freeze ,
  - Y delay adjustment, Chroma level, Tint, Black level,
  - Contrast ...etc..

### APPLICATION

NTSC, PAL-M, PAL-N color TV

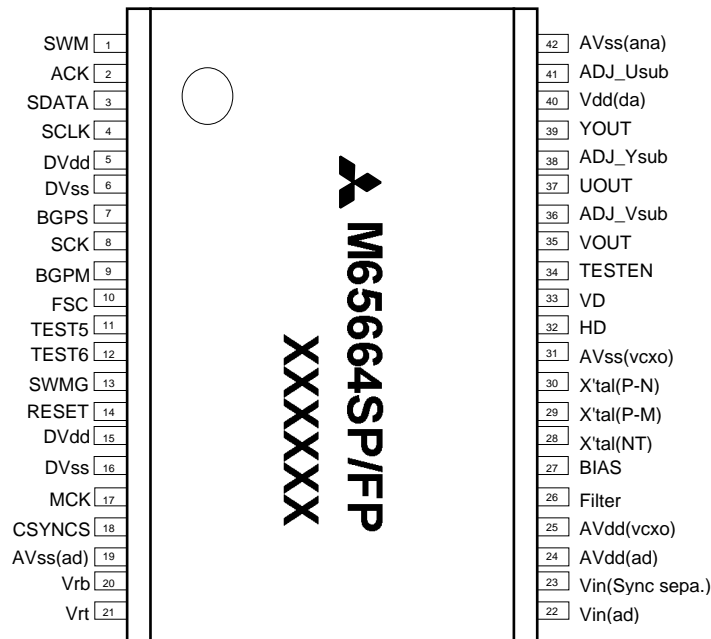

### RECOMMENDED OPERATING CONDITIONS

Supply voltage range	-----	3.2 ~ 3.5 V
Operating frequency	-----	14.32 MHz
Operating temperature	-----	0 ~ 70 deg.
Input voltage (CMOS interface)	"H" -----	VDD x 0.7 ~ VDD V
	"L" -----	0 ~ VDD x 0.3 V
Output current ( output buffer )	-----	4 mA ( MAX )
Output load capacitance	-----	20 pF ( MAX ) *1
Circuit current	-----	- mA

NOTICE: Connect a 0.1µF or larger capacitor between VDD and VSS pins.  
\*1 : Include pin capacitance ( 7 pF )

Block diagram & Application examples

### V2.0

#### PIN DESCRIPTION

Pin No.	Name	I/O	Function	Remarks
1	SWM	CMOS output	PIP switch output	
2	ACK	CMOS output	I2C SDA output (for high load SDA line use only)	
3	SDATA	CMOS I/O(5V)*1	I2C SDA input/output	
4	SCLK	CMOS input(5V)*1	I2C SCL input	
5	DVdd1	Digital Vdd	Vdd for digital part	
6	DVss1	Digital Vss	Vss for digital part	
7	BGPS	CMOS output	Test output	
8	SCK	CMOS input	Test input	connect to GND
9	BGPM	CMOS output	Test output	
10	FSC	CMOS input	Test input	connect to GND
11	TEST5	CMOS input	Test input	connect to GND
12	TEST6	CMOS input	Test input	connect to GND
13	SWMG	CMOS input		connect to Vdd
14	RESET	CMOS input	Power on reset input	
15	DVdd2	Digital Vdd	Vdd for digital part	
16	DVss2	Digital Vss	Vss for digital part	
17	MCK	CMOS input	Test input	connect to GND
18	CSYNCS	CMOS input	Sub picture external C-sync input	
19	AVss (ADC)	Analog Vss	Vss for internal ADC	
20	VRB	Analog	Low level reference voltage output of ADC	
21	VRT	Analog	High level reference voltage output of ADC	
22	VIN (ADC)	Analog	Sub picture input of ADC	
23	VIN (Sync Sep.)	Analog	Sub picture input of sync sep. for sub picture	
24	AVdd (ADC)	Analog Vdd	Vdd for internal ADC	
25	AVdd (VCXO)	Analog Vdd	Vdd for VCXO	
26	FILTER	Analog	VCXO filter voltage connection	
27	BIAS	Analog	VXCO bias voltage connection	
28	X'tal (NTSC)	Analog	X'tal of NTSC connection	
29	X'tal (PAL-M)	Analog	X'tal of PAL-M connection	
30	X'tal (PAL-N)	Analog	X'tal of PAL-N connection	
31	AVss (VCXO)	Analog Vss	Vss for VCXO	
32	HD	CMOS input(5V)*1	Main picture HD input	
33	VD	CMOS input(5V)*1	MAIN picture VD input	
34	TESTEN	CMOS input	Test input	connect to GND
35	VOUT	Analog	Sub picture V or B output	
36	ADJ_Vsub	Analog	Referece voltage connection of DAC of V	
37	UOUT	Analog	Sub picture U or G output	
38	ADJ_Ysub	Analog	Referece voltage connection of DAC of Y	
39	YOUT	Analog	Sub picture Y or R output	
40	AVdd (DAC)	Analog Vdd	Vdd for DAC	
41	ADJ_Usub	Analog	Referece voltage connection of DAC of U	
42	AVss (sub)	Analog Vss	Vss for substrate	

\*1 ) (5V)means 5V I/F torelant

MITSUBISHI DIGITAL TV ICs  
M65664SP/FP  
PICTURE-IN-PICTURE  
SIGNAL PROCESSING

V2.0

The relation of input signal 32-pin (Main-HD) and 33-pin (Main-VD) is shown below

Driving Method and Operating Specification for Serial Interface Data

(1) Serial data transmission completion and start

A low-to-high transition of the DATA (serial data) line while the CLK (serial clock) is high, that completes the serial transmission and makes the bus free.

A high-to-low transition of the DATA line while the CLK is high, that starts the serial transmission and waits for the following CLK and DATA inputs.

(2) Serial data transmission

The data are transmitted in the most significant bit (MSB) first by one-byte unit on the DATA line successively. One-byte data transmission is completed by 9 clock cycles, the former 8 cycles are for address/data and the latter one is for acknowledge detection. (In reading state, ACK is 'H' under these two conditions ; 1) the coincidence of two address data for the address data transmission, 2) the completion of 8-bit setting data transfer. In writing state, ACK is 'H' with the address coincidence and ACK is 'L' for detecting acknowledge input from the master (micro processor) after sending 8-bit setting data.)

For address/data transmission, DATA must change while CLK is 'L'. (The data change while CLK is 'H' or the simultaneous change of CLK and DATA, that will be a false operation because of undistinguished condition from the completion/start of serial data transfer).

After the beginning of serial data transmission, the total number of data bytes that can be transferred are not limited.

(3) The byte format of data transmission (The sequence of data transmission)

a. The byte format during data setting to M65664FP are shown as follows.

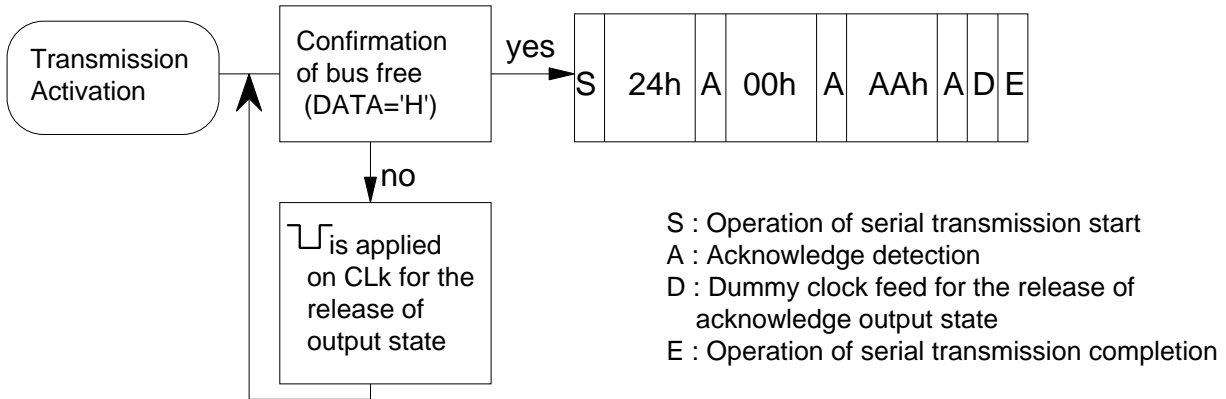

In right after the forming of serial data transmitting state, the slave address 24h (00100100b) is transferred. Afterwards, the internal register address (1 byte) and setting data (by 1 byte unit) are transferred successively. Several bytes of setting data can be handled in the one transmission. In this operation, the setting data are written into the address register whose address is increased one in initially transferred internal register address.

b. The byte format during data reading from M65664FP are shown as follows.

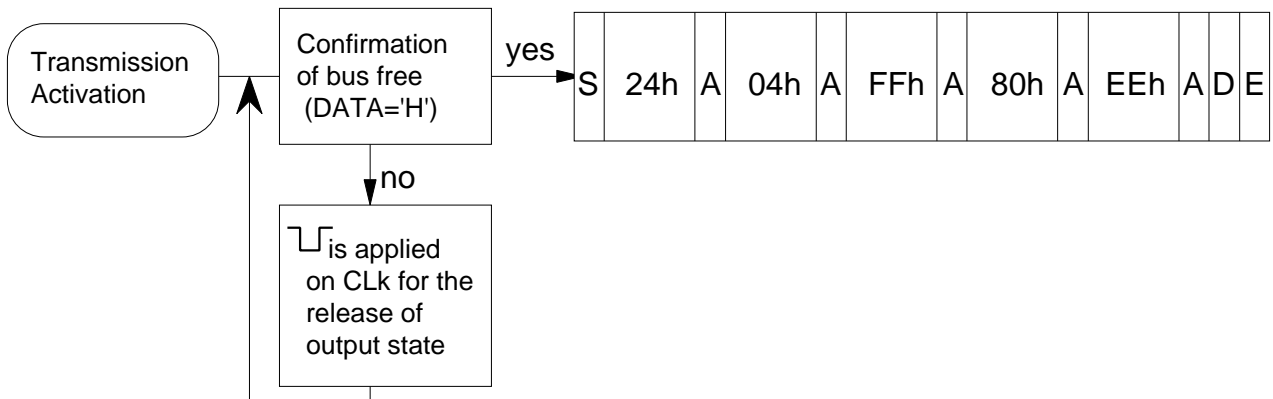

Before data reading from M65664FP, whose internal address need to be set by the data reading/transmitting. After the data reading/transmitting, the operation of "serial data transmission completion and start" (described in (1)) is necessary. Continuously, the slave address 25h (00100101b) is sent, and then the inverted read out data are available on ACK. Several bytes of writing data can be handled in the one transmission, too. In this operation, the setting data also are written into the address register whose address is increased one in initially transferred internal register address.

<The examples of serial byte transmission format>

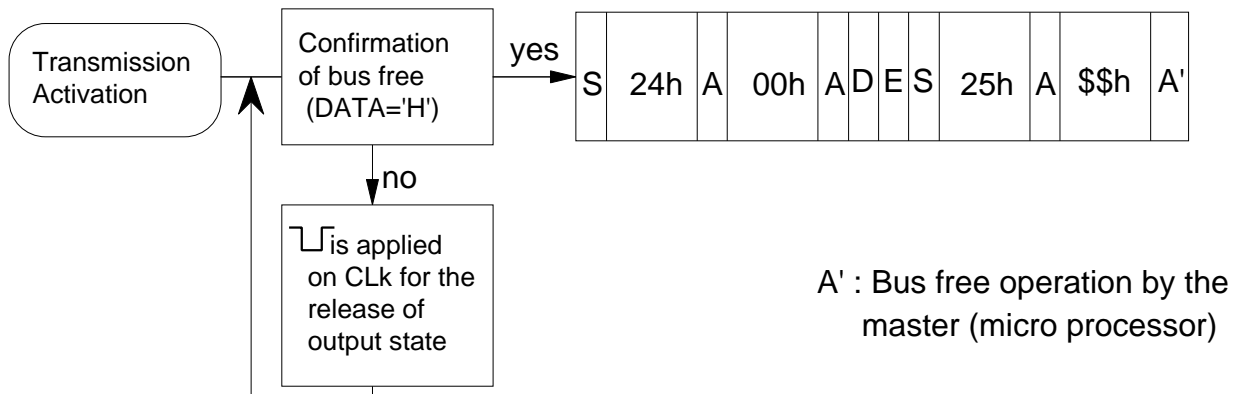

(1) The writing operation of the setting data (AAh) into M65664FP internal address of 00h

(2) The writing operation of the setting data (FFh, 80h, EEh) into M65664FP internal address of 04h ~ 06h

(3) The reading operation of the setting data from M65664FP internal address of 00h

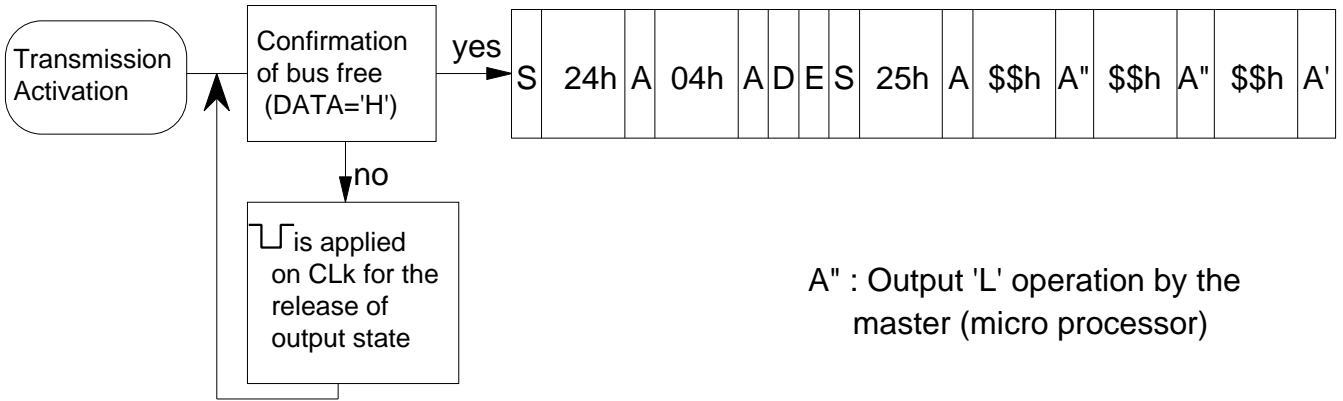

*PRELIMINARY*

Notice ; This is not the final specification.  
Some of information in this document are subject to changes.

**V2.0**

(4) The reading operation of the setting data from M65664FP internal address of 04h ~ 06h

**<Timing Diagram>**
