description

These TTL encoders feature priority decoding of the inputs to ensure that only the highest-order data line is encoded. The '147 and 'LS147 encode nine data lines to four-line (8-4-2-1) BCD. The implied decimal zero condition requires no input condition as zero is encoded when all nine data lines are at a high logic level. The '148 and 'LS148 encode eight data lines to three-line (4-2-1) binary (octal). Cascading circuitry (enable input EI and enable output EO) has been provided to allow octal expansion without the need for external circuitry. For all types, data inputs and outputs are active at the low logic level. All inputs are buffered to represent one normalized Series 54/74 or 54LS/74LS load, respectively.

Input voltage: '147, '148 . . . . . 5.5 V
'LS147, 'LS148 . . . . . 7 V
Interemitter voltage: '148 only (see Note 2) . . . . . 5.5 V
Operating free-air temperature range: SN54', SN54LS Circuits . . . . . −55°C to 125°C
SN74', SN74LS Circuits . . . . . 0°C to 70°C
Storage temperature range . . . . . −65°C to 150°C

NOTES: 1. Voltage values, except interemitter voltage, are with respect to network ground terminal.
2. This is the voltage between two emitters of a multiple-emitter transistor. For '148 circuits, this rating applies between any two of the eight data lines, 0 through 7.

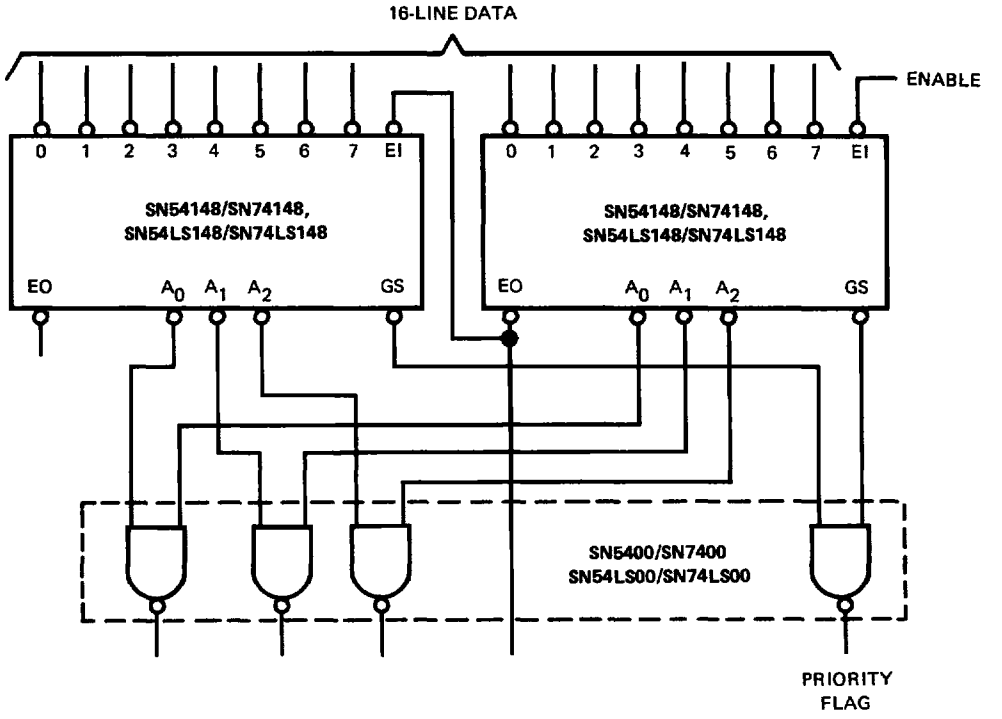
TYPICAL APPLICATION DATA



Full 4-bit binary 16-line-to-4-line encoding can be implemented as shown above. The enable input must be low to enable the function. Decoding with 2-input NAND gates produces true (active-high) data for the 4-line binary outputs. If active-low data is required, the SN5408/SN7408 or SN54LS08/SN74LS08 AND gate may be used, respectively.
