GENERAL DESCRIPTION

The Simple Technology STI334000 is a 4M x 33 bits Dynamic RAM high density memory module. The Simple Technology STI334000 consist of eight CMOS 4M x 4 DRAMs in 24-pin SOJ package and one CMOS 4M x 1 bit DRAMs in a 20-pin SOJ package mounted on a 72-pin glass epoxy substrate. A 0.1 μ F decoupling capacitor is mounted for each DRAM.

The STI334000 is a Single In-line Memory Module with tin or gold edge connections, 5V power supply, and 2K refresh. The STI334000 is intended for mounting into 72-pin edge connector sockets.

Notes:

1. An initial pause of 200 ms is required after power-up followed by any 8 $\overline{RAS}$ -Only or $\overline{CAS}$ -before- $\overline{RAS}$ refresh cycles before proper device operation is achieved.
2. $V_{IH(min)}$ and $V_{IL(max)}$ are reference levels for measuring timing of input signals. Transition times are measured between $V_{IH(min)}$ and $V_{IL(max)}$, and are assumed to be 5ns for all inputs.
3. Measure with a load equivalent to 2 TTL loads and 100pF.
4. Operation within the $t_{RCD(max)}$ limit insures that $t_{RAC(max)}$ can be met. $t_{RCD(max)}$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD(max)}$ limit, then access time is controlled exclusively by t_{CAC} .
5. Assumes that $t_{RCD} \geq t_{RCD(max)}$.
6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .
7. t_{WCS} is a non-restrictive operating parameter. It is included in the data sheet as electrical characteristic only. If $t_{WCS} \geq t_{WCS(min)}$, the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.
8. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
9. These parameters are referenced to the $\overline{CAS}$ leading edge in early write cycles.
10. Operation within the $t_{RAD(max)}$ limit insures that $t_{RAC(max)}$ can be met. $t_{RAD(max)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD(max)}$ limit, then access time is controlled by t_{AA} .
