

FEATURES

- 72-pin industry standard 4-byte single-in-line memory module
- JEDEC compliant: 21-C, Fig. 4-18 A,B (Release 6); No.95 MO-116
- Supports 90°, 40° and 22.5° connectors
- High performance, CMOS
- Single 5V $\pm$ 10% power supply
- TTL-compatible inputs and outputs
- EXTENDED DATA OUT (EDO) MODE access cycle
- Refresh modes: RAS-ONLY, CAS-BEFORE-RAS, HIDDEN
- Refresh: 2048 refresh cycles every 32 ms
- Dimensions: 4.25" (length) x 1.00" (height) x 0.360" (max thickness)

PERFORMANCE RANGE

CARD OUTLINE

GENERAL DESCRIPTION

The 8M x 32 SIMM uses EDO dynamic RAM devices and is designed for use as a general-purpose 4-byte wide memory assembly with 8 data bits per byte. The SIMM is populated with sixteen 4M x 4 DRAMs.

Presence Detect (PD) bits provide information about SIMM density, addressing, performance and features.

During Read or Write Cycles, each byte may be uniquely addressed via 22 address bits, with the first eleven bits (A0~A10) latched on $\overline{RAS}$ and the latter eleven bits (A0~A10) latched on $\overline{CAS}$. READ or WRITE cycles are selected with the $\overline{WE}$ input, with a logic low indicating a WRITE cycle and a logic HIGH indicating a READ cycle. During a WRITE cycle, data-in is latched by the falling edge of $\overline{WE}$ or $\overline{CAS}$, whichever occurs last.

EXTENDED DATA OUT (EDO) MODE operation allows for faster READs or WRITEs within a row-address-defined page boundary. EDO MODE is an enhanced FAST PAGE MODE method of operation. Because data output time is extended, the $\overline{CAS}$ cycle can be shorter than it is for FAST PAGE MODE. This allows for a reduction in READ or WRITE cycle time. An EDO MODE cycle is initiated with $\overline{RAS}$ followed by $\overline{CAS}$, then strobing $\overline{CAS}$ to latch different column addresses while holding $\overline{RAS}$ LOW.

Returning $\overline{RAS}$ and $\overline{CAS}$ high terminates a memory cycle and returns the DRAMs to a reduced-current STANDBY state.

Memory cell data is retained in its correct state by maintaining power and executing any $\overline{RAS}$ cycle (READ, WRITE) or $\overline{RAS}$ refresh cycle ($\overline{RAS}$ -ONLY, CBR, or HIDDEN) so that all 2048 combinations of $\overline{RAS}$ addresses (A0~A10) are executed at least every 32 ms. The CBR refresh and HIDDEN refresh cycles will invoke the on-chip refresh address counters for automatic $\overline{RAS}$ addressing.

PIN DESCRIPTION

RAS0~RAS3	Row Address Strobe
CAS0~CAS3	Column Address Strobe
WE	Write Enable
A0~A10	Address Inputs
DQ0~7,DQ9~16, DQ18~25,DQ27~34	Data In/Out
VCC	Power (+5.0V)
VSS	Ground
NC	No Connection

NOTES

1. Permanent damage to the device may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded. Functional operation should be restricted to the conditions as detailed in this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. All voltages referenced to V_{SS} .
3. I_{CC} is specified as an average current.
4. This parameter depends on output loading and/or cycle rates.
5. Specified values are obtained with the output open.
6. Address can be changed a maximum of once while $\overline{RAS}=V_{IL}$.
7. Address can be changed a maximum of once while $\overline{CAS}=V_{IH}$.
8. $V_{IH(min)}$ and $V_{IL(max)}$ are reference levels for measuring timing of input signals. Transition time (t_T) is measured between $V_{IH(min)}$ and $V_{IL(max)}$, and is assumed to be 2ns for all inputs. All input signals must transit between V_{IH} and V_{IL} (or V_{IL} and V_{IH}) without slope reversal.
9. Measured with a load equivalent to 2 TTL loads and 100pF.
10. Operation within the $t_{RCD(max)}$ limit ensures that $t_{RAC(max)}$ can be met. $t_{RCD(max)}$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD(max)}$ limit, then access time is controlled exclusively by t_{CAC} .
11. Assumes that $t_{RCD} \geq t_{RCD(max)}$, $t_{RAD} \leq t_{RAD(max)}$.
12. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .
13. This is a non-restrictive operating parameter. It is included in the data sheet as an electrical characteristic only. If $t_{WCS} \geq t_{WCS(min)}$ the cycle is an early write cycle and the data out pins will remain high impedance (open circuit) for the duration of the cycle. If the above condition is not satisfied, the condition of the data out (at access time) is indeterminate.
14. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
15. Operation within the $t_{RAD(max)}$ limit ensures that $t_{RAC(max)}$ can be met. $t_{RAD(max)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD(max)}$ limit, then access time is controlled exclusively by t_{AA} .
16. Specified values are obtained with minimum cycle time.
17. Specified values are obtained with $T_A=25^\circ\text{C}$.

18. An initial pause of 200 μ s is required after power-up followed by a minimum of eight initialization cycles (any 8 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ or $\overline{\text{RAS}}$ -only Refresh cycles with $\overline{\text{WE}}$ high) before proper device operation is assured. Also, any 8 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ or $\overline{\text{RAS}}$ -only Refresh cycles with $\overline{\text{WE}}$ high are required after prolonged periods (greater than t_{REF}) of $\overline{\text{RAS}}$ inactivity before proper device operation is assured.
19. Measured with a load equivalent to 50pF and 500 ohms.
20. Write cycle is applicable instead of read cycle. Timing requirements for $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and Address are the same for Hidden Refresh Write Cycle as that shown for Hidden Refresh Read Cycle. $\overline{\text{WE}}$, D_{IN} and D_{OUT} for Hidden Refresh Write Cycle are the same as for Write Cycle.
21. t_{CPA} is access time from $\overline{\text{CAS}}$ precharge (that is caused by changing $\overline{\text{CAS}}$ from "L" to "H"). Therefore, if t_{CP} is long, then t_{CPA} is longer than $t_{\text{CPA(max)}}$.
22. Calculated based on data supplied by the DRAM manufacturer(s).
23. Maximum value is calculated based on data supplied by the DRAM manufacturer(s).
24. Minimum value is calculated based on data supplied by the DRAM manufacturer(s).
25. This parameter is referenced to the $\overline{\text{CAS}}$ leading edge in Early Write cycles and to the $\overline{\text{WE}}$ leading edge in Read-Modify-Write cycles.
26. $V_{\text{IN}} = 0$ Volt.
27. Either t_{CDD} or t_{ODD} must be satisfied.
28. Either t_{DZC} or t_{DZO} must be satisfied.
29. $t_{\text{RASP(MIN)}}$ is specified as two cycles of $\overline{\text{CAS}}$ input are performed.
30. The access time is limited by all four parameters t_{RAC} , t_{CAC} , t_{AA} , t_{CPA} .
31. This assumes all $\overline{\text{RAS}}$ (and all $\overline{\text{CAS}}$ for CBR refresh) are active.
