DESCRIPTION

The UT54ACS374 and the UT54ACTS374 are non-inverting octal D type flip-flops with three-state outputs designed for driving highly capacitive or relatively low-impedance loads. The device is suitable for buffer registers, I/O ports, and bidirectional bus drivers.

The eight flip-flops are edge triggered D-type flip-flops. On the positive transition of the clock the Q outputs will follow the data (D) inputs.

An output-control input (\overline{OC}) places the eight outputs in either a normal logic state (high or low logic level) or a high-impedance state. The high-impedance third state and increased drive provide the capability to drive the bus line in a bus-organized system without the need for interface or pull-up components.

The output control \overline{OC} does not affect the internal operations of the flip-flops. Old data can be retained or new data can be entered while the outputs are off.

The devices are characterized over full military temperature range of -55°C to +125°C.

- Supplied as a design limit but not guaranteed or tested.
- Per MIL-M-38510, for current density $\leq 5.0E5$ amps/cm², the maximum product of load capacitance (per output buffer) times frequency should not exceed 3,765 pF MHz.
- Not more than one output may be shorted at a time for maximum duration of one second.
- Capacitance measured for initial qualification and when design changes may affect the value. Capacitance is measured between the designated terminal and V_{SS} at frequency of 1MHz and a signal amplitude of 50mV rms maximum.
- Maximum allowable relative shift equals 50mV.
- All specifications valid for radiation dose $\leq 1E6$ rads(Si).
- Power does not include power contribution of any TTL output sink current.
