
2-WIRE REAL-TIME CLOCK

S-35390A

The S-35390A is a low-current-consumption 2-wire CMOS real-time clock IC that features a wide operating voltage range (1.3 V to 5.5 V) and can be driven on a variety of supply voltages, from a main supply to a backup supply. The time keeping current consumption of 0.25 μ A and minimum time keeping operation voltage of 1.1 V enable greatly increased battery duration.

In a system that operates on a backup battery, the free register incorporated in the real-time clock can be used for the user backup memory function. The user register can hold data on a supply voltage as low as 1.2 V (min.), so the data stored in the register before the main power supply was cut can be called any time after the voltage is restored.

This product also includes a clock adjustment function that enables wide-ranging correction of deviation in the frequency of the crystal oscillator at a minimum resolution of 1 ppm. Also, by combining this function with a temperature sensor, the clock adjustment value can be set in accordance with changes in the temperature, which makes it possible to realize a clock function that retains a high degree of accuracy regardless of temperature variation.

■ Features

- Low current consumption: 0.25 μ A typ. ($V_{DD} = 3.0$ V, $T_a = 25^\circ\text{C}$)
- Wide operating voltage range: 1.3 to 5.5 V
- Minimum time keeping operation voltage: 1.1 V
- Built-in clock adjustment function
- Built-in free user register
- 2-wire (I²C-BUS)^{*1} CPU interface
- Built-in alarm interrupter
- Built-in flag generator at power down or power on
- Auto calendar up to the year 2099, automatic leap year calculation function
- Built-in constant voltage circuit
- Built-in 32 kHz crystal oscillator circuit (C_d built in, C_g external)
- Package: 8-pin SOP (JEDEC), 8-pin TSSOP, SNT-8A

*1. I²C-BUS is a trademark of Philips Electronics N.V.

■ Applications

- Digital still cameras
- Digital video cameras
- Electronic power meters
- DVD recorders
- TVs, VCRs
- PHS
- Mobile phones
- Car navigation

■ **Packages**

Package Name	Drawing Code		
	Package	Tape	Reel
8-Pin SOP(JEDEC)	FJ008-A	FJ008-D	FJ008-D
8-Pin TSSOP	FT008-A	FT008-E	FT008-E
SNT-8A	PH008-A	PH008-A	PH008-A

■ Description of Pins

Table 1

Pin No.	Symbol	Description	Configuration
1	$\overline{\text{INT1}}$	Interrupt 1 signal output pin Depending on the mode set by INT1 register_1 and the status register, it outputs low or a clock when the time is reached. It is disabled by rewriting the status register.	Nch open-drain output (no protective diode on the side of VDD)
2	XOUT	Crystal oscillator connect pin (32,768 Hz) (C _d built in, C _g external)	—
3	XIN		
4	VSS	Negative power supply pin (GND)	—
5	$\overline{\text{INT2}}$	Interrupt 2 signal output pin Depending on the mode set by INT1 register_2 and the status register, it outputs low or clock when time is reached. It is disabled by rewriting the status register.	Nch open-drain output (no protective diode on the side of VDD)
6	SCL	Serial clock input pin Since signal processing is done on the SCL signal rising/falling edge, give great care to the rising/falling time and comply strictly with the specifications.	CMOS input (no protective diode on the side of VDD)
7	SDA	Serial data I/O pin Normally, it is pulled up to the V _{DD} voltage by a resistor and connected with another open-drain output or open-collector output device via a wired-OR connection.	Nch open-drain output (no protective diode on the side of VDD) CMOS input
8	VDD	Positive power supply pin	—

■ Absolute Maximum Ratings

Table 2

Parameter	Symbol	Applicable Pin	Rating	Unit
Power supply voltage	V_{DD}	—	$V_{SS} - 0.3$ to $V_{SS} + 6.5$	V
Input voltage	V_{IN}	SCL, SDA	$V_{SS} - 0.3$ to $V_{SS} + 6.5$	V
Output voltage	V_{OUT}	SDA, $\overline{INT1}$, $\overline{INT2}$	$V_{SS} - 0.3$ to $V_{SS} + 6.5$	V
Operating temperature	T_{opr}	—	-40 to +85	°C
Storage temperature	T_{stg}	—	-55 to +125	°C

Caution The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

■ Recommended Operating Conditions

Table 3

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Power supply voltage	V_{DD}	$T_a = -40$ to $+85^\circ\text{C}$	1.3	3.0	5.5	V
Operating temperature	T_{opr}	$V_{DD} = 1.3$ to 5.5 V	-40	+25	+85	°C
Time keeping voltage range	V_{DDT}	$T_a = -40$ to $+85^\circ\text{C}$	V_{DDTm}	—	5.5	V
Register hold voltage	V_{DH}	$T_a = -40$ to $+85^\circ\text{C}$	V_{DDTm}	—	5.5	V
Minimum time keeping voltage range	V_{DDTm}	$T_a = -40$ to $+85^\circ\text{C}$	0.5 ^{*1}	—	1.1	V
Crystal oscillator C_L value	C_L	—	—	—	7.0	pF

*1. Reference value

■ Oscillation Characteristics

Table 4

($T_a = 25^\circ\text{C}$, $V_{DD} = 3.0$ V, DS-VT-200 crystal oscillator ($C_L = 6$ pF, 32,768 Hz) manufactured by Seiko Instruments Inc.)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Oscillation start voltage	V_{STA}	Within 10 seconds	1.1	—	5.5	V
Oscillation start time	t_{STA}	$V_{DD} = 3.0$ V	—	—	1	s
IC-to-IC frequency deviation ^{*1}	δIC	—	-10	—	+10	ppm
Frequency voltage deviation	δV	$V_{DD} = 1.3$ to 5.5 V	-3	—	+3	ppm/V
Internal oscillation capacitance (1)	C_g	Applied to XIN pin	0	—	9.1	pF
Internal oscillation capacitance (2)	C_d	Applied to XOUT pin	—	8	—	pF

■ **DC Electrical Characteristics**

Table 5 DC Characteristics (V_{DD} = 3.0 V)

(Ta = -40 to +85°C, V_{DD} = 3.0 V, DS-VT-200 crystal oscillator (C_L = 6 pF, 32,768 Hz, C_g = 9.1 pF) manufactured by Seiko Instruments Inc.)

Parameter	Symbol	Applicable Pin	Conditions	Min.	Typ.	Max.	Unit
Current consumption 1	I _{DD1}	—	Out of communication	—	0.25	0.93	μA
Current consumption 2	I _{DD2}	—	During communication (SCL = 100 kHz)	—	6	14	μA
Input current leakage 1	I _{IZH}	SCL, SDA	V _{IN} = V _{DD}	-0.5	—	0.5	μA
Input current leakage 2	I _{IZL}	SCL, SDA	V _{IN} = V _{SS}	-0.5	—	0.5	μA
Output current leakage 1	I _{OZH}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$, SDA	V _{OUT} = V _{DD}	-0.5	—	0.5	μA
Output current leakage 2	I _{OZL}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$, SDA	V _{OUT} = V _{SS}	-0.5	—	0.5	μA
Input voltage 1	V _{IH}	SCL, SDA	—	0.8 × V _{DD}	—	—	V
Input voltage 2	V _{IL}	SCL, SDA	—	—	—	0.2 × V _{DD}	V
Output current 1	I _{OL1}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$	V _{OUT} = 0.4 V	3.0	5.0	—	mA
Output current 2	I _{OL2}	SDA	V _{OUT} = 0.4 V	5	10	—	mA
Power supply voltage detection voltage *1	V _{DET}	—	Ta = -40 to +85°C	V _{DDTm} + 0.15 *2	—	V _{DDTm} + 0.4	V

*1. Power supply voltage detection voltage: Constantly maintains the relation of V_{DET} > V_{DDTm} (minimum time keeping voltage). Refer to **Characteristics**.

*2. Reference value

Table 6 DC Characteristics (V_{DD} = 5.0 V)

(Ta = -40 to +85°C, V_{DD} = 5.0 V, DS-VT-200 crystal oscillator (C_L = 6 pF, 32,768 Hz, C_g = 9.1 pF) manufactured by Seiko Instruments Inc.)

Parameter	Symbol	Applicable Pin	Conditions	Min.	Typ.	Max.	Unit
Current consumption 1	I _{DD1}	—	Out of communication	—	0.3	1.1	μA
Current consumption 2	I _{DD2}	—	During communication (SCL = 100 kHz)	—	14	30	μA
Input current leakage 1	I _{IZH}	SCL, SDA	V _{IN} = V _{DD}	-0.5	—	0.5	μA
Input current leakage 2	I _{IZL}	SCL, SDA	V _{IN} = V _{SS}	-0.5	—	0.5	μA
Output current leakage 1	I _{OZH}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$, SDA	V _{OUT} = V _{DD}	-0.5	—	0.5	μA
Output current leakage 2	I _{OZL}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$, SDA	V _{OUT} = V _{SS}	-0.5	—	0.5	μA
Input voltage 1	V _{IH}	SCL, SDA	—	0.8 × V _{DD}	—	—	V
Input voltage 2	V _{IL}	SCL, SDA	—	—	—	0.2 × V _{DD}	V
Output current 1	I _{OL1}	$\overline{\text{INT1}}$, $\overline{\text{INT2}}$	V _{OUT} = 0.4 V	3.0	8.0	—	mA
Output current 2	I _{OL2}	SDA	V _{OUT} = 0.4 V	6	13	—	mA
Power supply voltage detection voltage *1	V _{DET}	—	Ta = -40 to +85°C	V _{DDTm} + 0.15 *2	—	V _{DDTm} + 0.4	V

*1. Power supply voltage detection voltage: Constantly maintains the relation of V_{DET} > V_{DDTm} (minimum time keeping voltage). Refer to **Characetristics**.

*2. Reference value

■ AC Electrical Characteristics

Table 7 Measurement Conditions

Input pulse voltage	$0.1 \times V_{DD}$ to $0.9 \times V_{DD}$
Input pulse rise/fall time	20 ns
Output determination voltage	$0.5 \times V_{DD}$
Output load	100 pF + pull-up resistor 1 k Ω

Remark The power supplies of the IC and load have the same electrical potential.

Figure 5 Output Load Circuit

Table 8 AC Characteristics

($T_a = -40$ to $+85^\circ\text{C}$)

Parameter	Symbol	$V_{DD} = 1.3$ to 5.5 V			$V_{DD} = 3.0$ to 5.5 V			Unit
		Min.	Typ.	Max.	Min.	Typ.	Max.	
SCL clock frequency	f_{SCL}	0	—	100	0	—	400	kHz
SCL clock "L" time	t_{LOW}	4.7	—	—	1	—	—	μs
SCL clock "H" time	t_{HIGH}	4	—	—	0.9	—	—	μs
SDA output delay time ^{*1}	t_{PD}	—	—	3.5	—	—	0.9	μs
Start condition setup time	$t_{SU, STA}$	4.7	—	—	0.6	—	—	μs
Start condition hold time	$t_{HD, STA}$	4	—	—	0.6	—	—	μs
Data input setup time	$t_{SU, DAT}$	250	—	—	100	—	—	ns
Data input hold time	$t_{HD, DAT}$	0	—	—	0	—	—	ns
Stop condition setup time	$t_{SU, STO}$	4.7	—	—	—	—	—	μs
SCL and SDA rise time	t_R	—	—	1	—	—	0.3	μs
SCL and SDA fall time	t_F	—	—	0.3	—	—	0.3	μs
Bus release time	t_{BUF}	4.7	—	—	1.3	—	—	μs
Noise suppression time	t_I	—	—	100	—	—	50	ns

*1. Since the output format of the SDA pin is Nch open-drain output, the SDA output delay time is determined by the values of the load resistance (R_L) and load capacity (C_L) outside the IC. Therefore, use this value only as a reference value.

■ Timing Chart

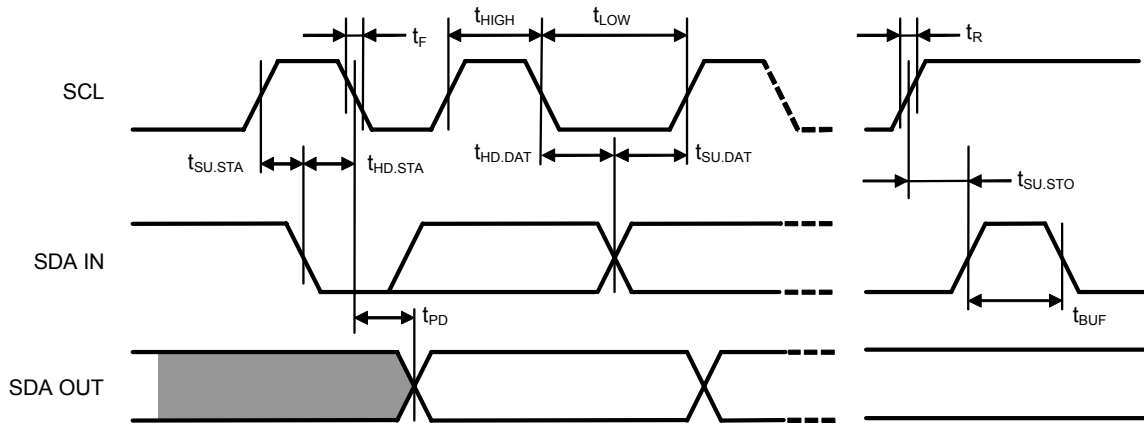

Figure 6 Bus Timing

■ Operation

1. Communication data configuration

The master device on the system generates a start condition to the slave device to communicate. Then it transmits a 4-bit device address, 3-bit command, and 1-bit read/write command on the SDA bus. The higher 4 bits that indicate the device address are called the device code and are fixed to "0110". Refer to "Serial Interface".

Figure 7 Communication Data

2. Command configuration

There are eight types of commands that read from and write to various registers. The table below lists these commands.

Table 9 Command List

Command				Data							
C2	C1	C0	Description	B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	Status register_1 access	POC ^{*4}	BLD ^{*4}	INT2 ^{*3}	INT1 ^{*3}	SC1 ^{*2}	SC0 ^{*2}	12/24	RESET ^{*1}
0	0	1	Status register_2 access	TEST ^{*5}	INT2AE	INT2ME	INT2FE	32kE	INT1AE	INT1ME	INT1FE
0	1	0	Real-time data 1 access (year data to)	Y80	Y40	Y20	Y10	Y8	Y4	Y2	Y1
				— ^{*6}	— ^{*6}	— ^{*6}	M10	M8	M4	M2	M1

1	1	1	Free register access	F7	F6	F5	F4	F3	F2	F1	F0

- *1. Write-only flag. By writing "1" to this register, the IC is reset.
- *2. Scratch bit. R/W-enabled register that can be freely used by users.
- *3. Read-only flag. It is cleared when read. It is valid only when the alarm is set.
- *4. Read-only flag. "POC" is set to "1" when power is applied. It is cleared when read. For the "BLD", refer to "Power Supply Voltage Detector".
- *5. For IC testing. Normally set this register to "0".
- *6. No effect by writing. It is "0" when read.
- *7. This is a R/W-enabled register that does not affect interrupts.

■ Register Configuration

1. Real-time data register

The real-time data register is a 56-bit register that stores the BCD code of the year, month, day, day of week, hour, minute, and second data. Any read/write operation performed by the real-time data access command transmits or receives the data from the LSB which is the first digit of the year.

Figure 8 Real-time Data Register

2. Status register_1

Status register_1 is an 8-bit register that is used to display and set various modes. The bit configuration is shown below.

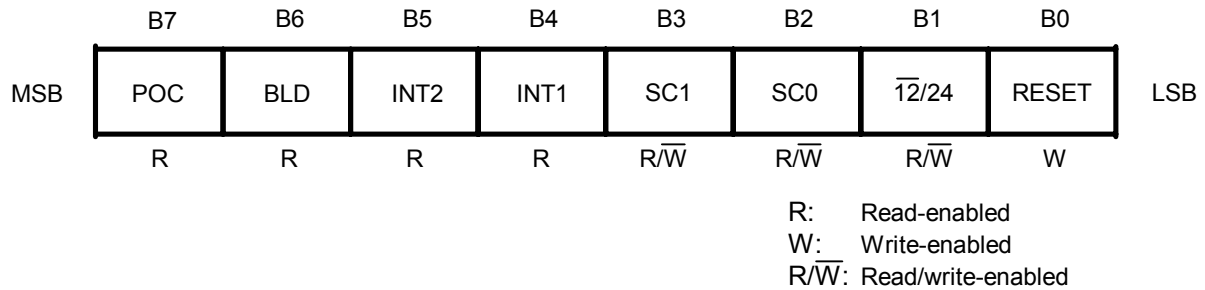

Figure 9 Status Register_1

- B7: POC** This flag is set to “1” at power-on. Once this flag is set to “1”, it is not set to “0” even when the power supply voltage reaches or exceeds the detection voltage (V_{DET}). This flag is read-only and can be read by the status register_1 access command. Once it is read, it is automatically set to “0”. When the flag is “1”, it must be initialized. For the method of initialization, refer to “**Initialization at Power-on and Power-on Detector**”.
- B6: BLD** If the power supply voltage detector detects a voltage of detection voltage (V_{DET}) or less this flag is set to “1”, which enables the detection of a power supply voltage drop. Once this flag is set to “1”, it is not set to “0” even when the power supply voltage reaches or exceeds the detection voltage (V_{DET}). This flag is read-only and can be read by the status register_1 access command. Once it is read, it is automatically set to “0”. When the flag is “1”, it must be initialized. For the method of initialization, refer to “**Initialization at Power-on and Power-on Detector**”, and for the operation of the power supply voltage detector, refer to “**Power Supply Voltage Detector**”.
- B5, B4: INT2, INT1**
- When the interrupt signal is output from the $\overline{INT1}$ or $\overline{INT2}$ pin using the alarm interrupt function, for an interrupt signal output from the $\overline{INT1}$ pin, the INT1 flag is set to “1”, and for an interrupt signal output from the $\overline{INT2}$ pin, the INT2 flag is set to “1”.
- B3, B2: SC1, SC0**
- These flags configure a 2-bit SRAM type register that can be freely set by users. They are read and written within the operating voltage range (1.3 to 5.5 V).
- B1: $\overline{12}/24$** This flag is used to set 12-hour or 24-hour expression.
- 0: 12-hour expression
1: 24-hour expression
- B0: RESET** By setting this bit to “1”, the internal IC is initialized. This is a write-only bit and is always “0” when it is read. Be sure to write “1” to the reset flag when applying the power supply voltage to the IC.

3. Status Register_2

Status register_2 is an 8-bit register that is used to display and set various modes. The bit configuration is shown below.

Figure 10 Status Register_2

B7: TEST The TEST flag is a bit for testing the IC. If the TEST flag is set to “1”, the IC is switched to the TEST mode. If this flag is “1”, it is necessary to initialize it to “0” by setting the reset flag of status register_1 to “1”.

B6: INT2AE, B5: INT2ME, B4: INT2FE

These flags are used to select the output mode from the $\overline{\text{INT2}}$ pin. Mode selections are shown below. When using the alarm 2 function, after setting the alarm interrupt mode, access INT1 register_2.

Table 10 Interrupt Modes ($\overline{\text{INT2}}$)

INT2AE	INT2ME	INT2FE	$\overline{\text{INT2}}$ Pin Output Mode
0	0	0	No interrupt
*1	0	1	Selected frequency steady interrupt
*1	1	0	Per-minute edge interrupt
*1	1	1	Per-minute steady interrupt 1 (50% duty)
1	0	0	Alarm interrupt

*1. Don't care (Both of 0 and 1 are acceptable).

B3: 32kE, B2: INT1AE, B1: INT1ME, B0: INT1FE

These flags are used to select the output mode from the $\overline{\text{INT1}}$ pin. Mode selections are shown below. When using the alarm 1 function, after setting the alarm interrupt mode, access INT1 register_1.

Table 11 Interrupt Modes ($\overline{\text{INT1}}$)

32kE	INT1AE	INT1ME	INT1FE	$\overline{\text{INT1}}$ Pin Output Mode
0	0	0	0	No interrupt
1	*1	*1	*1	32 kHz output
0	*1	0	1	Selected frequency steady interrupt
0	*1	1	0	Per-minute edge interrupt
0	0	1	1	Per-minute steady interrupt 1 (50% duty)
0	1	0	0	Alarm interrupt
0	1	1	1	Per-minute steady interrupt 2

*1. Don't care (Both of 0 and 1 are acceptable).

4. INT1 register_1 and INT1 register_2

INT1 register_1 and INT1 register_2 are interrupt setting registers that can be set independently. The interrupts are output from the INT1 pin and INT2 pin. The function is switched by using status register_2.

(1) Alarm interrupt

Data set in INT1 register_1 and INT1 register_2 is considered as alarm time data. Having the same configuration as the hour and minute registers of the real-time data register, these registers represent hours and minutes with BCD codes. When setting these registers, do not set any nonexistent day. Data to be set must be in accordance with the 12-hour or 24-hour expression that is set in status register_1.

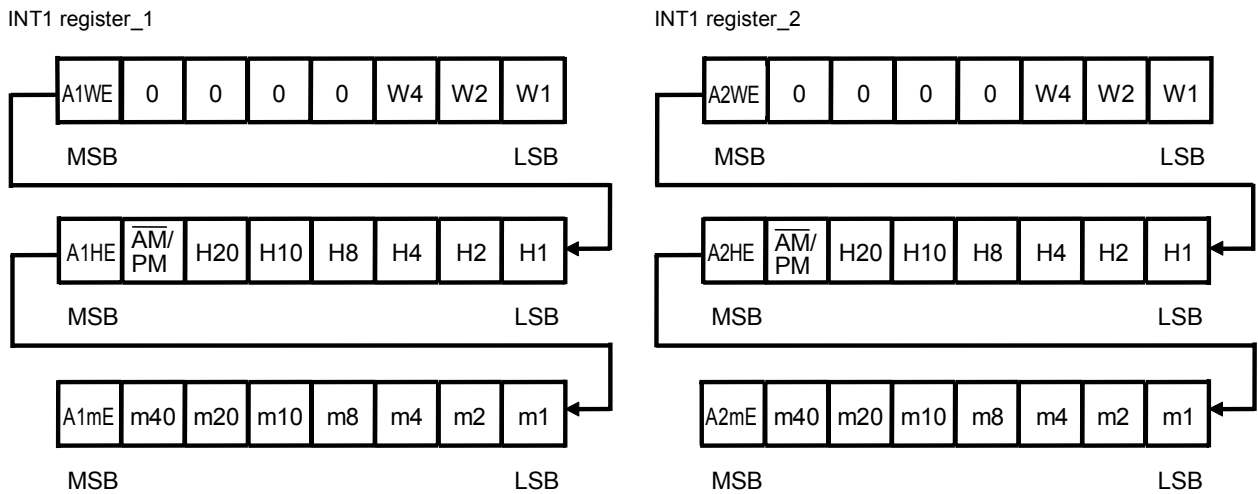

Figure 11 INT1 Register_1, INT1 Register_2 (Alarm Time Data)

In INT1 register_1, A1WE, A1HE, and A1mE are respectively in the MSB of each byte. By setting each bit to “1”, the setting of the day of week data, hour data, and minute data in the corresponding byte becomes valid. A2WE, A2HE, and A2mE of INT1 register_2 are the same.

The example of setting In case of the setting alarm time “PM 7:00” in INT1 register_1

(1) 12-hour expression (status register_1 B1 = 0)

: set up 7:00 PM
Writing in INT1 register_1

Day of week data	0	__*1	__*1	__*1	__*1	__*1	__*1
Hour data	1	1	0	0	0	1	1
Minute data	1	0	0	0	0	0	0
	MSB						LSB

*1. Don't care (Both of 0 and 1 are acceptable).

(2) 24-hour expression (status register_1 B1 = 1)

: set up 19:00 PM
Writing in INT1 register_1

Day of week data	0	__*1	__*1	__*1	__*1	__*1	__*1
Hour data	1	1*2	0	1	1	0	1
Minute data	1	0	0	0	0	0	0
	MSB						LSB

*1. Don't care (Both of 0 and 1 are acceptable).

*2. Set up AM/PM flag along with the time setting.

(2) Selected frequency steady interrupt

Data set in INT1 register_1 and INT1 register_2 is considered as frequency duty data. By setting each bit from B4 to B0 of the register to "1", the frequency corresponding to each bit is selected in an ANDed form. The SC bits configure a 3-bit SRAM type register that can be set freely by users. These bits can be read and written within the operating voltage range (1.3 to 5.5 V). There is no impact on the duty function.

Figure 12 INT1 Register_1 and INT1 Register_2 (Frequency Duty Data)

Example B4 to B0 = 0Ah

Figure 13 INT1 Register_1 and INT1 Register_2 (Frequency Duty Data) Output Example

5. Clock adjustment register

The clock adjustment register is a 1-byte register that is used to logically correct real-time data. When not using the clock adjustment register, set this register to 00h using the clock adjustment register write command.

For the “register value”, refer to “**Clock Adjustment Function**”.

Figure 14 Clock Adjustment Register

6. Free register

The free register is a 1-byte SRAM type register that can be set freely by users. It can be read and written within the operating voltage range (1.3 to 5.5 V).

Figure 15 Free Register

■ Initialization at Power-on and Power-on Detector

When power is applied to this IC, status register_1 is set to “80h” (bit 7 (POC flag) of status register_1 is set to “1”) by the power-on detector and a 1 Hz clock is output from the $\overline{\text{INT1}}$ pin. This function is provided to adjust the oscillation frequency. In normal use, the IC must be initialized at power-on. Initialization is performed by writing “1” to bit 0 (RESET flag) of status register_1. Also, the IC must be initialized when the POC flag is set to “1”. After initialization, the POC flag is set to “0”. For normal operation of the power-on detector, first hold the IC power supply voltage at 0 V and then increase it.

■ Register State After Initialization

The state of each register after initialization is as follows.

Real-time data register:	00 (year), 01 (month), 01 (day), 0 (day of week), 00 (hour), 00 (minute), 00 (second)
Status register_1:	“0 0 0 0 B3 B2 B1 0 b” (The B3, B2, and B1 data of status register_1 after initialization are set in B3, B2, and B1.)
Status register_2:	“00h”
INT1 register_1:	“00h”
INT1 register_2:	“00h”
Clock adjustment register:	“00h”
Free register:	“00h”

■ Power Supply Voltage Detector

S-35390A has an internal power supply voltage detector, which monitors drops in the power supply voltage by reading the BLD flag. This circuit samples the voltage for only 15.6 ms per second. If the power supply voltage drops below the detection voltage (V_{DET}), the BLD latch circuit latches the “H” level, bit 6 (BLD flag) of internal status register_1 is set to “1”, and sampling stops. Detection voltage and release voltage have approximate 0.15 V (Typ.) of hysteresis width respectively (Refer to “**Characteristics**”). Once “1” is detected in the BLD flag, no detection operation is performed unless initialization is performed or the BLD flag is read by the status register_1 access command, and “1” is held in the BLD flag. Sampling resumes only when the subsequent communication action is initialization or BLD flag read.

In addition, if this BLD flag is “1” after the power supply voltage is recovered, it must be initialized.

Caution In case the power supply voltage falls and returns after the latch circuit latches “H”, the BLD flag can be read as “1” by a status register_1 access command first. After that the sampling is resumed and the read-out of the next BLD flag is performed, the BLD flag is reset and read as “0”. Refer to the timing chart below.

Figure 16 Timing of Power Supply Voltage Detector

■ **Processing of Nonexistent Data and End-of-Month**

When real-time data is written, the data is checked for validity, invalid data is processed, and the end-of-month is corrected.

1. Processing of nonexistent data

Table 12 Processing of Nonexistent Data

Register	Normal Data	Error Data	Result
Year data	00 to 99	XA to XF, AX to FX	00
Month data	01 to 12	00, 13 to 19, XA to XF	01
Day data	01 to 31	00, 32 to 39, XA to XF	01
Day of week data	0 to 6	7	0
Hour data ^{*1} (24-hour)	0 to 23	24 to 29, 3X, XA to XF	00
(12-hour)	0 to 11	12 to 19, 2X, 3X, XA to XF	00
Minute data	00 to 59	60 to 79, XA to XF	00
Second data ^{*2}	00 to 59	60 to 79, XA to XF	00

*1. For 12-hour expression, write the $\overline{\text{AM/PM}}$ flag.

The $\overline{\text{AM/PM}}$ flag is ignored in 24-hour expression, but "0" for 0 to 11 hours and "1" for 12 to 23 hours are read in a read operation.

*2. Processing of nonexistent data for second data is performed by a carry pulse one second after the end of writing. At this point, the carry pulse is sent to the minute counter.

2. Processing of end-of-month

A nonexistent day is set to the first day of the next month. If February 30th is written, March 1st is set. Leap year correction is also performed at this time.

■ Interrupts

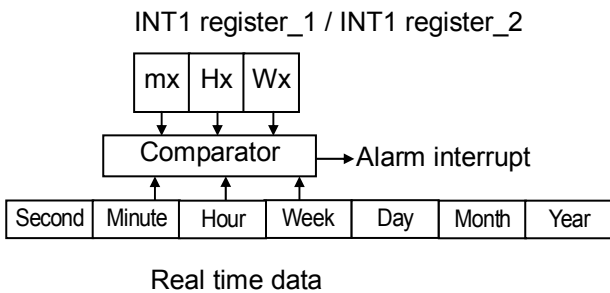

The $\overline{\text{INT1}}$ pin output mode is selected by the INT1AE, INT1ME, and INT1FE flags of status register_2. Similarly, the $\overline{\text{INT2}}$ pin output mode is selected by the INT2AE, INT2ME, and INT2FE flags of status register_2.

(1) Alarm interrupt output

When the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin output mode is set as the alarm setting using status register_2 and the day of week, hour, and minute data is set in INT1 register_1 (or INT1 register_2), low is output from the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin when the set hour is reached. Since the output is held, rewrite INT1AE of status register_2 to "0" (or INT2AE to "0") using serial communication to set the output to high (OFF state).

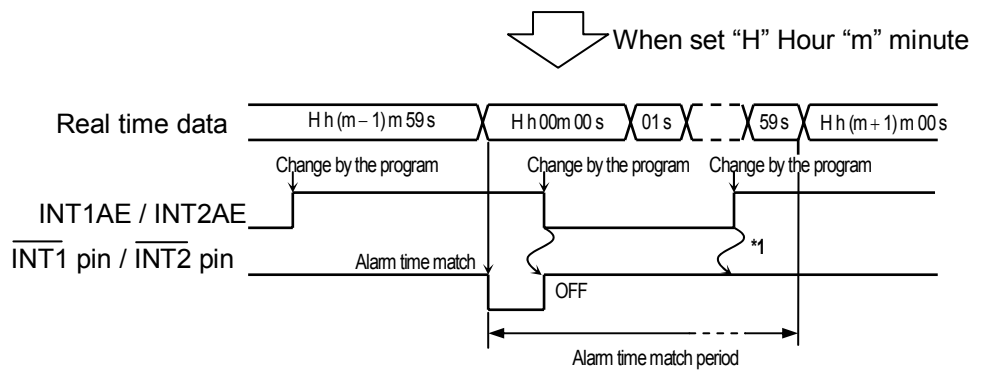

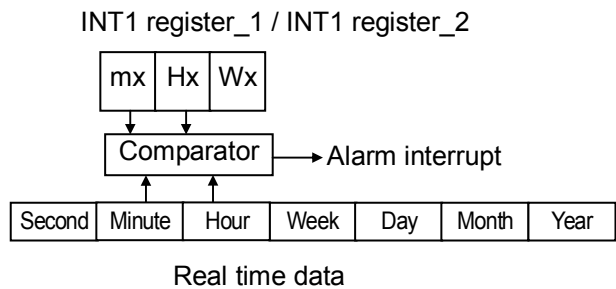

32kE = 0, INT1ME = INT1FE = 0
($\overline{\text{INT1}}$ pin output mode)
INT2ME = INT2FE = 0
($\overline{\text{INT2}}$ pin output mode)

Alarm enable flag
In case of AxWE = AxHE = AxmE = "1"

32kE = 0, INT1ME = INT1FE = 0
($\overline{\text{INT1}}$ pin output mode)
INT2ME = INT2FE = 0
($\overline{\text{INT2}}$ pin output mode)

Alarm enable flag
In case of AxWE = "0", AxHE = AxmE = "1"

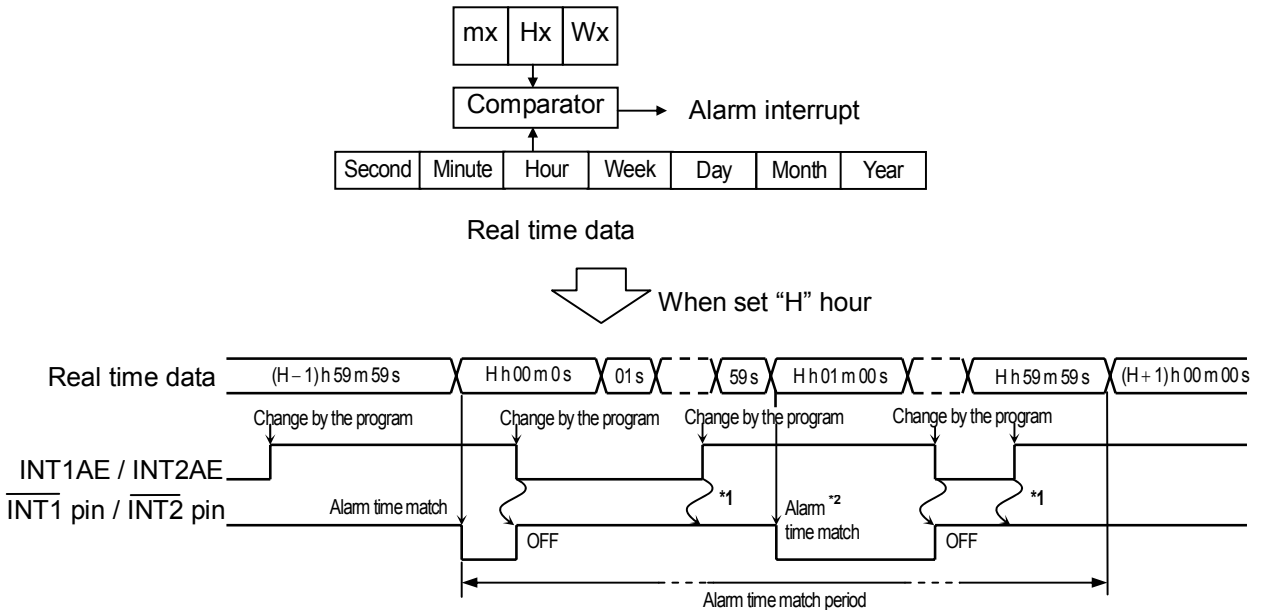

32kE = 0, INT1ME = INT1FE = 0
 ($\overline{\text{INT1}}$ pin output mode)

INT2ME = INT2FE = 0
 ($\overline{\text{INT2}}$ pin output mode)

Alarm enable flag

In case of AxWE = AxmE = "0", AxHE = "1"

INT1 register_1 / INT1 register_2

- *1. Once it clears, even if it enables again within a coincidence period, "L" will not be output from an $\overline{\text{INT1}}$ pin (or $\overline{\text{INT2}}$ pin).
- *2. When an alarm output is turned on by change by the program within a coincidence period, "L" is again output from an $\overline{\text{INT}}$ pin at the time of change of the following part.

Figure 17 Timing of Alarm Interrupt Output

(2) Selected frequency steady interrupt output

When the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin output mode is set as the selected frequency steady interrupt setting using status register_2 and the frequency/duty data is set in INT1 register_1 (or INT1 register_2), the set clock is output.

32kE = 0, INT1ME = 0, INT1AE = Don't care (0 or 1)
 INT2ME = 0, INT2AE = Don't care (0 or 1)

Figure 18 Timing of Selected Frequency Steady Interrupt Output

(3) Per-minute edge interrupt output

When the first minute carry is performed after the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin output mode is set as the per-minute edge interrupt using status register_2, low is output from the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin. Since the output is held, in the $\overline{\text{INT1}}$ pin output mode, rewrite 32kE, INT1AE, INT1ME, and INT1FE of status register_2 to "0", and in the $\overline{\text{INT2}}$ pin output mode, rewrite INT2AE, INT2ME, and INT2FE of status register_2 to "0" using serial communication to set the output to high (OFF state).

32kE = 0, INT1ME = 0, INT1AE = Don't care (0 or 1)
INT2ME = 0, INT2AE = Don't care (0 or 1)

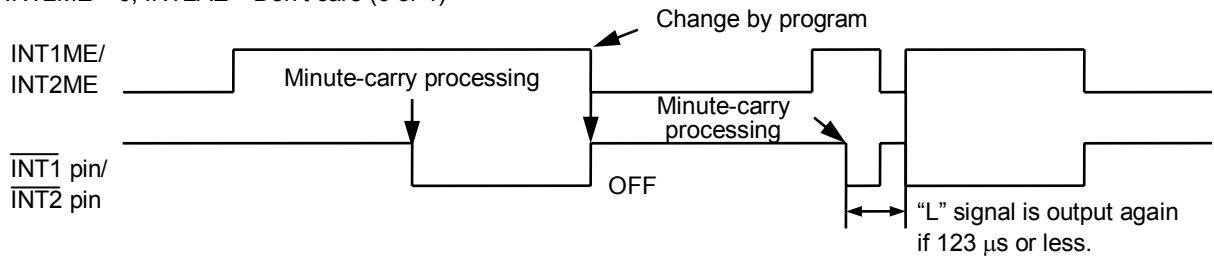

Figure 19 Timing of Per-Minute Edge Interrupt Output

Caution Since the minute carry processing signal is retained for 123 μs, if communication disable or enable is executed during this period, low is output from the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin again.

(4) Per-minute steady interrupt output 1

When the first minute carry is performed after the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin output mode is set as per-minute steady interrupt 1 using status register_2, a clock whose cycle is 1 minute (50% duty) is output from the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin.

32kE = 0, INT1AE = 0 ($\overline{\text{INT1}}$ pin output mode)
INT2AE = 0 ($\overline{\text{INT2}}$ pin output mode)

Figure 20 Timing of Per-Minute Steady Interrupt Output 1

Caution When communication disable or enable is executed while the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin is low, low is output from the $\overline{\text{INT1}}$ (or $\overline{\text{INT2}}$) pin again.

(5) Per-minute steady interrupt output 2 ($\overline{\text{INT1}}$ pin output mode only)

When the first minute carry is performed after the $\overline{\text{INT1}}$ pin output mode is set as per-minute steady interrupt 2 using status register_2, low is output from the $\overline{\text{INT1}}$ pin for a period of 7.9 ms in synchronization with the minute carry processing inside the IC. However, when real-time data is read, the minute carry processing is delayed by a maximum of 0.5 s and accordingly low output from the $\overline{\text{INT1}}$ pin is also delayed by a maximum of 0.5 s. When the second data is rewritten by a real-time data write command, counting starts from the rewritten second data and as a result, the output interval during that period may become either longer or shorter.

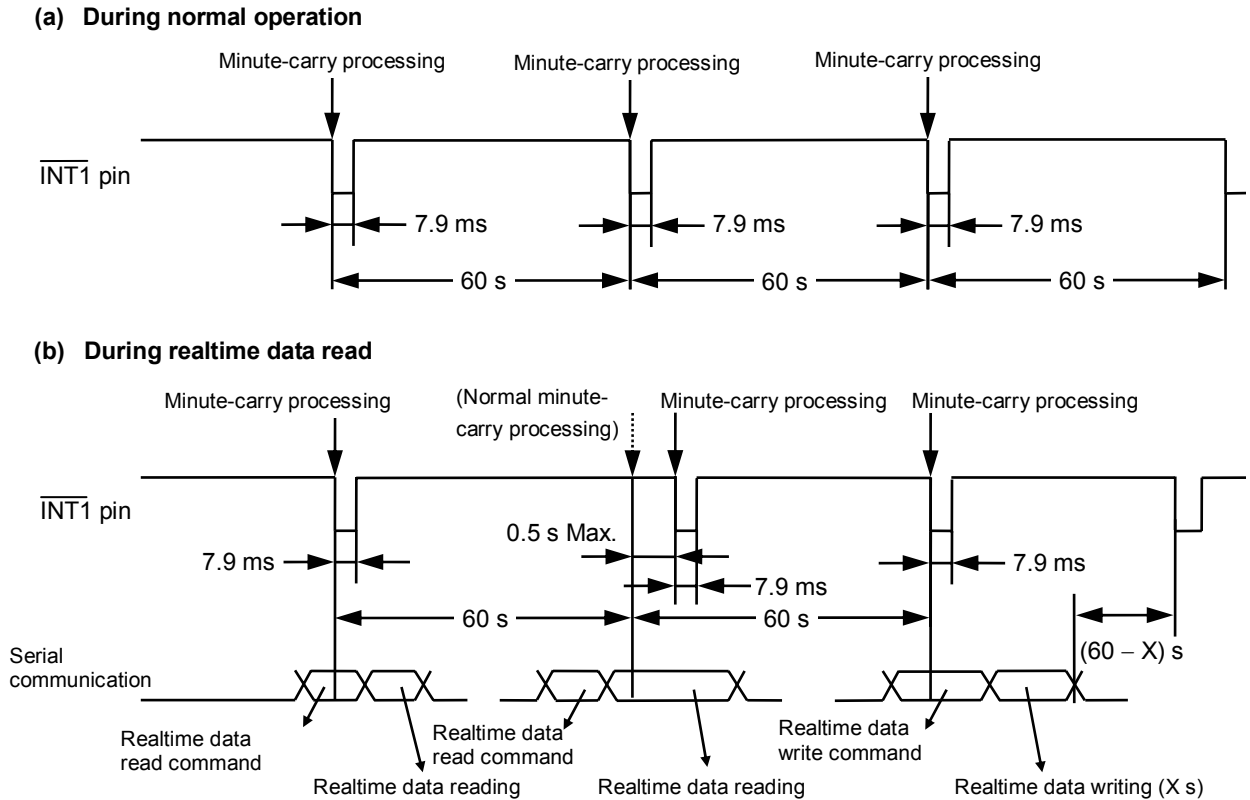

Figure 21 Timing of Per-Minute Steady Interrupt Output 2

- Caution**
1. When changing an output mode, give care to the state of INT1 register_1 (or INT1 register_2) and the output.
 2. If per-minute edge interrupt output or per-minute steady interrupt output is chosen, INT1 register_1 (or INT1 register_2) has no meaning.

(6) During power-on detector operation

When power is applied to this IC, power-on detection circuit operates, status register_1 is set to "80h" (bit 7 (POC flag) of status register_1 is set to 1) via the power-on detection circuit, and a 1 Hz clock is output from the $\overline{\text{INT1}}$ pin.

Figure 22 $\overline{\text{INT1}}$ Pin Output Timing During Power-on Detector Operation

■ **Clock Adjustment Function**

A clock adjustment function is provided to logically perform slow/fast adjustment of the 32 kHz clock and correct a slow/fast clock with high accuracy. Use the clock adjustment register to set this function. When not using this function, be sure to set it to 00h.

The clock adjustment register value is calculated by the following expression.

(1) If current oscillation frequency > target frequency (in case the clock is fast)

$$\text{Register value}^{*1} = 128 - \text{Integral value} \left(\frac{(\text{Current oscillation frequency actual measurement value}^{*2}) - (\text{Target oscillation frequency}^{*3})}{(\text{Current oscillation frequency actual measurement value}^{*2}) \times (\text{Minimum resolution}^{*4})} \right)$$

Caution The figure range which can be corrected is that the calculated value is from 0 to 64.

- *1. The register value is the value set to the clock adjustment register. Set the binarized value of this value to the clock adjustment register.
- *2. This is the measurement value of the signal that is output to the $\overline{\text{INT1}}$ pin or $\overline{\text{INT2}}$ pin when the 1 Hz clock output setting is:
 32kE = 0, INT1ME = 0, INT1FE = 1, INT1 register_1 is 01h (for the $\overline{\text{INT1}}$ pin)
 INT2ME = 0, INT2FE = 1, INT1 register_2 is 01h (for the $\overline{\text{INT2}}$ pin)
- *3. This is the frequency to be adjusted by using the clock adjustment function.
- *4. For the minimum resolution, 3.052 ppm or 1.017 ppm can be set using B7 of the clock adjustment register. When B7 is 0, 3.052 ppm is set and logical slow/fast adjustment is performed every 20 seconds. When B7 is 1, 1.017 ppm is set and logical slow/fast adjustment is performed every 60 seconds.

Table 13

	B7 = 0	B7 = 1
Slow/fast adjustment	Every 20 seconds	Every 60 seconds
Minimum resolution	3.052 ppm	1.017 ppm
Correction range	-195.3 ppm to +192.2 ppm	-65.1 ppm to +64.1 ppm

◆ The example of calculated value 1

Current oscillation frequency actual measurement value = 1.000080 [Hz],
 Target oscillation frequency = 1.000000 [Hz],
 B7 = 0 (minimum resolution = 3.052 ppm),

$$\begin{aligned} \text{Register value} &= 128 - \text{Integral value} \left(\frac{(1.000080) - (1.000000)}{(1.000080) \times (3.052 \times 10^{-6})} \right) \\ &= 128 - \text{Integral value} (26.21) = 128 - 26 = 102 \end{aligned}$$

Thus, set up (B7,B6,B5,B4,B3,B2,B1,B0) = (0,1,1,0,0,1,1,0) for the clock adjustment register.

(2) If current oscillation frequency < target frequency (in case the clock is slow)

$$\text{Register value} = \text{Integral value} \left(\frac{(\text{Target oscillation frequency}) - (\text{Current oscillation frequency actual measurement value})}{(\text{Current oscillation frequency}) \times (\text{Minimum resolution})} \right) + 1$$

Caution The figure range which can be corrected is that the calculated value is from 0 to 62.

◆ The example of calculated value 2

Current oscillation frequency actual measurement value = 0.999920 [Hz],
Target oscillation frequency = 1.000000 [Hz],
B7 = 0 (minimum resolution = 3.052 ppm),

$$\text{Register value} = \text{Integral value} \left(\frac{(1.000000) - (0.999920)}{(0.999920) \times (3.052 \times 10^{-6})} \right) + 1$$

$$= \text{Integral value } (26.21) + 1 = 26 + 1 = 27$$

Thus, set up (B7,B6,B5,B4,B3,B2,B1,B0) = (0,0,0,1,1,0,1,1) for the clock register.

◆ The example of calculated value 3

Current oscillation frequency actual measurement value = 0.999920 [Hz],
Target oscillation frequency = 1.000000 [Hz],
B7 = 1 (minimum resolution = 1.017 ppm),

$$\text{Register value} = \text{Integral value} \left(\frac{(1.000000) - (0.999920)}{(0.999920) \times (1.017 \times 10^{-6})} \right) + 1$$

$$= \text{Integral value } (78.66) + 1$$

Thus, this calculated value exceeds the correctable range 0 to 62,
B7 = "1" (minimum resolution = 1.017 ppm) indicates the correction is impossible.

Serial Interface

The S-35390A receives various commands via an I²C-BUS serial interface to read/write data. This section covers the transfer methods via I²C-BUS.

1. Start condition

The start condition is established at the point where the SDA line changes from “H” to “L” when the SCL line is “H” level. All operations start with the start condition.

2. Stop condition

The stop condition is established at the point where the SDA line changes from “L” to “H” when the SCL line is “H” level. If the stop condition is received during a readout sequence, the read operation is discontinued and the device enters the standby mode.

Figure 23 Start Condition and Stop Condition

3. Data transfer

Data transfer is performed by changing the SDA line during the period that the SCL line is “L”. If the SDA line changes during the period that the SCL line is “H”, it is recognized as the start or stop condition.

Figure 24 Timing of Data Transfer

4. Acknowledge

Data is transferred 8 bits in a row. Subsequently, in the 9th clock cycle period, the device on the system bus that is receiving the data changes the SDA line to “L” and returns the acknowledge signal to acknowledge data reception.

Figure 25 Timing of Acknowledge Output

5. Data reading

After detecting the start condition from outside, a device code and command are received. If the read/write bit is “1” at this point, the data read mode is entered. The data output sequence is output from the LSB.

6. Data writing

After detecting the start condition from outside, a device code and command are received. If the read/write bit is "0" at this point, the real-time data write mode or another register write mode is entered. Input the data input sequence for both the real-time data write mode and status register write mode from the LSB. In real-time data writing, the calendar and time counter is reset by the rising of the ACK signal after the real-time write command and update operations are then prohibited. Subsequently, when minute data reception is completed, an end-of-month correction is performed while the second data is loaded. Counting up is started from the rising of the ACK signal after the second data reception.

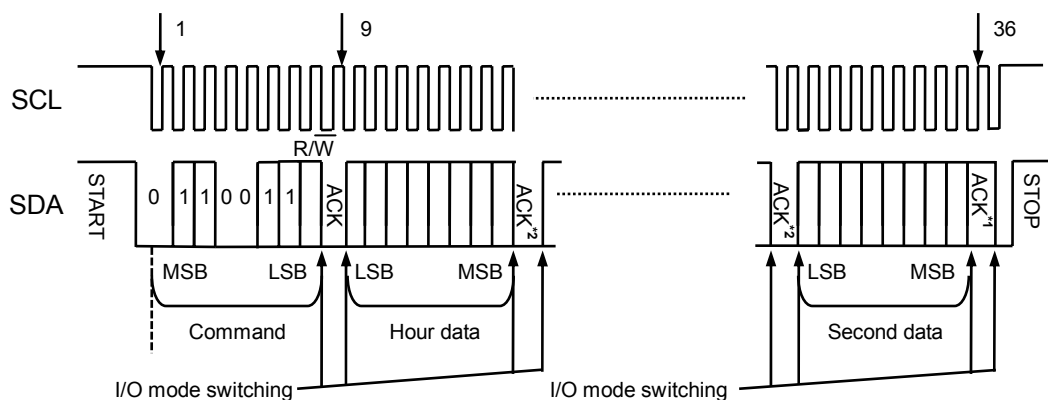

(1) Real-time data access 1

- *1. During reading, set NO_ACK to 1.
- *2. During reading, transmit ACK = 0 to S-35390A from the master device.

Figure 26 Real-time Data Access 1

(2) Real-time data access 2

- *1. During reading, set NO_ACK to 1.
- *2. During reading, transmit ACK = 0 to S-35390A from the master device.

Figure 27 Real-time Data Access 2

(3) Status register_1 access and status register_2 access

- *1. 0: Status register_1 selected, 1: Status register_2 selected
- *2. During reading, set NO_ACK to 1.

Figure 28 Status Register_1 Access and Status Register_2 Access

(4) INT1 register_1 access and INT1 register_2 access

Since data written to and read from INT1 register_1 varies according to the setting of status register_2, be sure to set status register_2 before reading/writing INT1 register_1. When an alarm is set using status register_2, these registers function as 3-byte alarm time data registers, and other than that, they function as 1-byte registers. When the selected frequency steady interrupt setting is set, the data in these registers is frequency duty setting data.

Caution Alarm data and frequency duty data cannot be operated simultaneously.

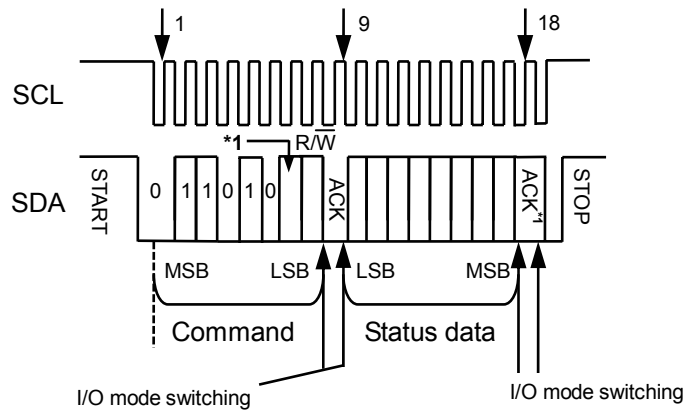

Since data written to and read from INT1 register_2 varies according to the setting of status register_2, be sure to set status register_2 before reading/writing INT1 register_1. When an alarm is set using status register_2, these registers function as 3-byte alarm time data registers, and other than that, they function as 1-byte registers. When the selected frequency steady interrupt setting is set, the data in these registers is frequency duty setting data.

For details of each data, refer to “**Status register_1**” and “**Status register_2**”.

- *1. 0: INT1 register_1 selected, 1:INT1 register_2 selected
- *2. During reading, set NO_ACK to 1.
- *3. During reading, transmit ACK = 0 to S-35390A from the master device.

Figure 29 INT1 Register_1 Access and INT1 Register_2 Access

- *1. 0: INT1 register_1 selected, 1:INT1 register_2 selected
- *2. During reading, set NO_ACK to 1.

Figure 30 INT1 Register_1 and INT1 Register_2 (Frequency Duty Data) Access

(5) Clock adjustment register access

- *1. During reading, set NO_ACK to 1.

Figure 31 Clock Adjustment Register Access

(6) Free register access

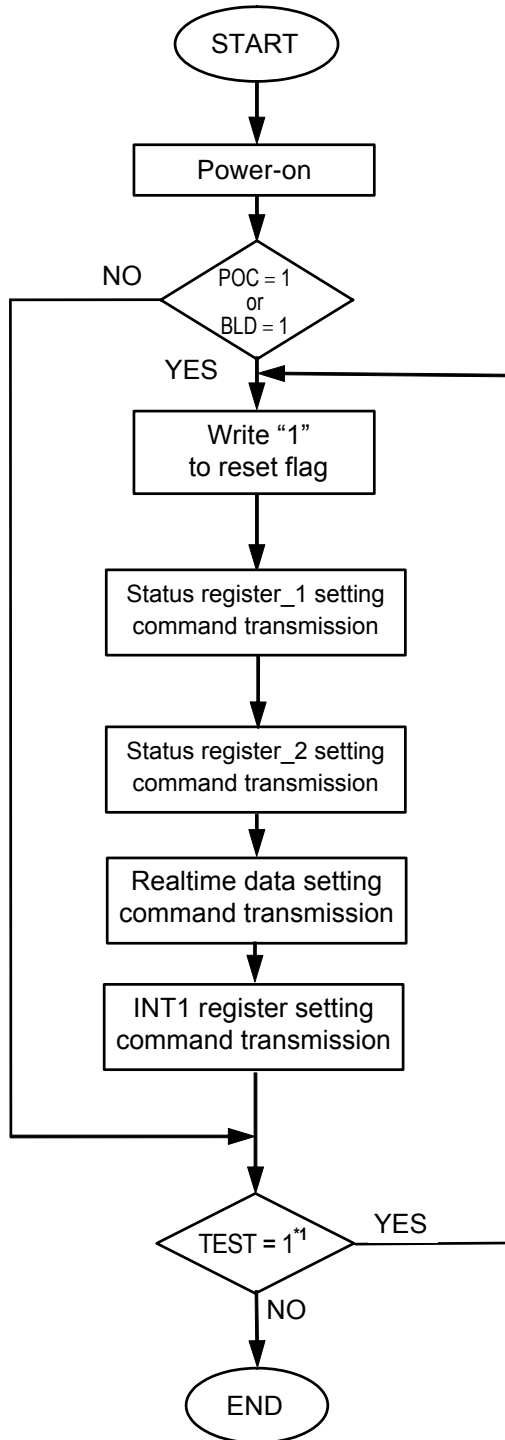

- *1. During reading, set NO_ACK to 1.

Figure 32 Free Register Access

■ Example of Software Processing

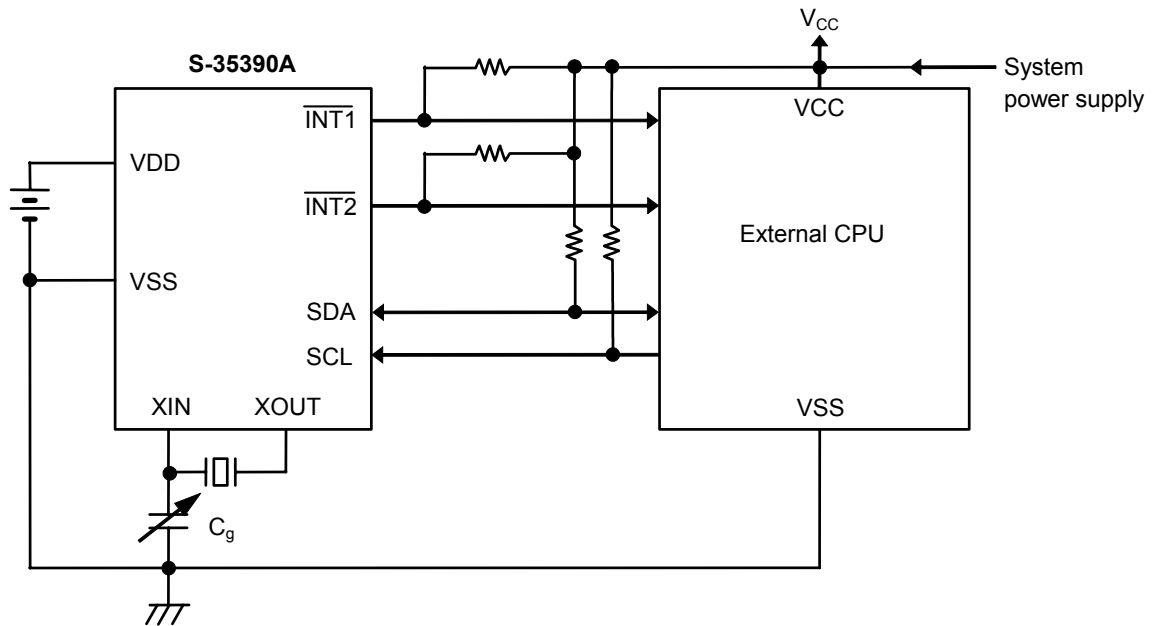

1. Initialization flow at power-on

*1. If conditions are poor (e.g., in a noisy environment) and there is a high probability that commands transmitted via serial communication will be garbled, it is recommended to verify the TEST flag.

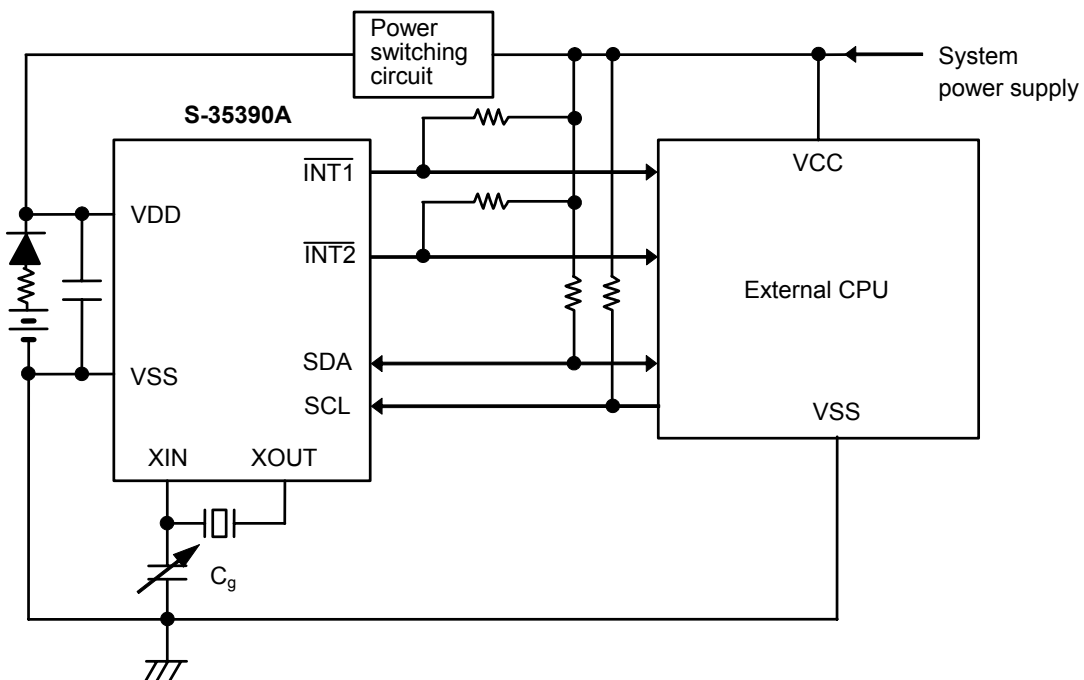

Figure 33 Initialization Flow

■ Examples of Application Circuits

- Caution**
1. Because the I/O pin has no protective diode on the V_{DD} side, the relation of V_{CC} ≥ V_{DD} is possible. But pay careful attention to the specifications.
 2. Communication should be executed after the system power supply is turned on and a stable state is obtained.

Figure 34 Application Circuit 1

- Caution** Communication should be executed after the system power supply is turned on and a stable state is obtained.

Figure 35 Application Circuit 2

- Caution** The above connection diagrams do not guarantee operation. Set the constants after performing sufficient evaluation using the actual application.

■ Adjustment of Oscillation Frequency

1. Configuration of oscillator

Since crystal oscillation is sensitive to external noise (the clock accuracy is affected), the following measures are essential for optimizing the oscillator configuration.

- (1) Place the S-35390A, crystal oscillator, and external capacitor (C_g) as close to each other as possible.
- (2) Increase the insulation resistance between pins and the substrate wiring patterns of XIN and XOUT.
- (3) Do not place any signal or power lines close to the oscillator.

*1. When using the crystal oscillator with a C_L value of 7 pF, externally connect C_d .

Figure 36 Connection Diagram 1

Figure 37 Connection Diagram 2

2. Measurement of oscillation frequency

When the S-35390A is turned on, the internal power-on detector operates and a signal of 1 Hz is output from the $\overline{\text{INT1}}$ pin to select the crystal oscillator and optimize the C_g value. Turn the power on and measure the signal with a frequency counter following the circuit configuration shown in **Figure 38**. A signal of 1 Hz may not be output depending on the state in which power is applied, so set the selected frequency steady interrupt using status register_2 and then set 1 Hz signal output using INT1 register_1 to generate a normal output. For further details, refer to “**Interrupts**”.

Remark If the error range is ± 1 ppm in relation to 1 Hz, the time is shifted by approximately 2.6 seconds per month (calculated using the following expression).

$$10^{-6} (1 \text{ ppm}) \times 60 \text{ seconds} \times 60 \text{ minutes} \times 24 \text{ hours} \times 30 \text{ days} = 2.592 \text{ seconds}$$

Figure 38 Configuration of Oscillation Frequency Measurement Circuit

- Caution**
1. Use a high-accuracy frequency counter (1 ppm order).
 2. Since the 1 Hz signal continues to be output, initialization must be executed during normal operation.
 3. Refer to the frequency slow/fast range characteristics for C_g .

3. Adjustment of oscillation frequency

(1) Adjustment by setting C_g

Matching of the crystal oscillator with the nominal frequency must be performed with the stray capacitance on the board included. Select a crystal oscillator and optimize the C_g value in accordance with the flowchart below.

- *1. For the matching adjustment of the IC with a crystal, contact the crystal manufacturer to determine the C_L value (load capacitance) and R_1 value (equivalent series resistance). $C_L = 6$ pF and $R_1 = 30$ k Ω typ. are recommended values.
- *2. The C_g value must be selected on the actual PCB since it is affected by stray capacitance. Select the external C_g value in a range of 0 pF to 9.1 pF.
- *3. Adjust the rotation angle of the variable capacitance so that the capacitance value is slightly smaller than the center, and confirm the oscillation frequency and the center value of the variable capacitance. This is done in order to make the capacitance of the center value smaller than one half of the actual capacitance value because a smaller capacitance value increases the frequency variation.

Figure 39 Crystal Oscillator Setting Flow

- Caution**
1. The oscillation frequency varies depending on the ambient temperature and power supply voltage. Refer to the characteristics examples.
 2. The 32 kHz crystal oscillator operates more slowly at an operating temperature than higher or lower 20 to 25°C. Therefore, it is recommended to adjust or set the oscillator to operate slightly faster at normal temperature.

■ Product Name Structure

1. 8-Pin SOP(JEDEC), 8-Pin TSSOP package

2. SNT-8A package

■ Precautions

- Although the IC contains a static electricity protection circuit, static electricity or voltage that exceeds the limit of the protection circuit should not be applied.
- Seiko Instruments Inc. assumes no responsibility for the way in which this IC is used in products created using this IC or for the specifications of that product, nor does Seiko Instruments Inc. assume any responsibility for any infringement of patents or copyrights by products that include this IC either in Japan or in other countries.

■ I²C-BUS License

Purchase of I²C components of Seiko Instruments Inc., conveys a license under the Philips I²C Patent. Rights to use these components in an I²C system, is granted provided that the system conforms to the I²C Standard Specification as defined by Philips.

Please note that a product or a system incorporating this IC may infringe upon the Philips I²C Patent Rights depending upon its configuration. In the event of such infringement Seiko Instruments Inc., shall not bear any responsibility for any matters with regard to and arising from such patent infringement.

■ Characteristics (Reference Values)
