Overview

The Rambus® RIMM™ module is a general purpose high-performance memory module suitable for use in a broad range of applications including computer memory, personal computers, workstations, and other applications where high bandwidth and low latency are required.

The Rambus RIMM module consists of 128Mb/144Mb Direct Rambus DRAM devices. These are extremely high-speed CMOS DRAMs organized as 8M words by 16 or 18 bits. The use of Rambus Signaling Level (RSL) technology permits 600 MHz, 711 MHz or 800 MHz transfer rates while using conventional system and board design technologies. RDRAM devices are capable of sustained data transfers at 1.25 ns per two bytes (10ns per 16 bytes).

The RDRAM architecture enables the highest sustained bandwidth for multiple, simultaneous, randomly addressed, memory transactions. The separate control and data buses with independent row and column control yield over 95% bus efficiency. The RDRAM's 32-bank architecture supports up to four simultaneous transactions per device.

a. Table 10 lists parameters and specifications for different storage capacity RIMM Modules that use 128Mb or 144Mb RDRAM devices.

b. T_{PD} or Average clock delay is defined as the average delay from finger to finger of all RSL clock nets (CTM, CTMN, CFM, and CFMN).

c. If the RIMM module meets the following specification, then it is compliant to the specification. If the RIMM module does not meet these specifications, then the specification can be adjusted by the "Adjusted ΔT_{PD} Specification" table below.

Adjusted ΔT_{PD} Specification

Table 9: Adjusted ΔT_{PD} Specification

Symbol	Parameter and Conditions	Adjusted Min/Max	Absolute Min / Max		Unit
ΔT_{PD}	Propagation delay variation of RSL signals with respect to T_{PD} for 4, 6, and 8 device modules	$\pm[17+(18*N*\Delta Z0)]^a$	-30	30	ps

	Propagation delay variation of RSL signals with respect to T_{PD} for 16 device modules	$\pm[24+(18*N*\Delta Z0)]^a$	-50	50	ps

a. Where: N = Number of RDRAM devices installed on the RIMM module

$\Delta Z0 = \text{delta } Z0\% = (\text{max } Z0 - \text{min } Z0)/(\text{min } Z0)$

(max Z0 and min Z0 are obtained from the loaded (high impedance) impedance coupons of all RSL layers on the modules)

Standard RIMM Module Marking

The RIMM modules available from Samsung are marked like Figure 5 below. This marking also assists users to specify and verify if the correct RIMM modules are installed in their systems. In the diagram, a label is shown attached to the

RIMM module's heat spreader. Information contained on the label is specific to the RIMM module and provides RDRAM information without requiring removal of the RIMM module's heat spreader.
