has...

DESCRIPTION

The SD-14531 is a low-cost, high reliability, programmable synchro/resolver-to-digital converter with pin programmable 14- or 16-bit resolution. Packaged in a 36-pin DDIP, the SD-14531 features Built-In-Test (BIT) output.

The SD-14531 series accepts broadband inputs: 360 to 1 kHz, or 47 to 1 kHz. Other features include solid-state signal and reference isolation and high common-mode rejection. The digital angle output from the SD-14531 is a natural binary code, parallel positive logic and is TTL/CMOS compatible. Synchronization to a computer is accomplished with the Converter Busy (CB) output and/or the Inhibit (INH) input.

APPLICATIONS

Because of its high reliability, small size, and low power consumption, the SD-14531 is ideal for military ground or avionics applications. All models are available with MIL-PRF-38534 processing.

Designed with three-state output, the SD-14531 is especially well suited for use with computer based systems. Among the many possible applications are radar and navigation systems, fire control systems, flight instrumentation and flight trainers or simulators.

FEATURES

- Single +5 V Power Supply
- Accuracy to 1.3 Arc-Minutes
- Pin Programmable Synchro/Resolver Input Option
- Pin Programmable 14-Bit or 16-Bit Resolution
- No 180° False Lock-up
- Internal Synthesized Reference
- Built-In-Test (BIT) Output
- Low Power Consumption
- Pin-for-Pin Replacement for Natel's 1006 and 1056

Input Impedance	148 kΩ min L- L balanced resistive	
Input Common-Mode Voltage	±500 V rms, transformer isolated	
Output Description	Resolver output, - Sine (- S) + Cosine (+C) derived from op-amps. Short circuit proof.	
Output Voltage	1.0 V rms nominal riding on ground reference V. Output voltage level tracks input level.	
Power Required	4 mA typ, 7 mA max from +15 V supply.	

Notes:

- (1) Pin Programmable.
- (2) VEL polarity is negative voltage for positive angular rate.
- (3) XX5 ordering option = ±1.3 minutes resolver mode, ±1.6 minutes synchro mode (16-bit mode only).

THEORY OF OPERATION

The SD-14531 Series are small, 36-pin DDIP synchro-to-digital hybrid converters. As shown in the block diagram (FIGURE 1), the SD-14531 can be broken down into the following functional parts: Signal Input Option, Converter, Analog Conditioner, Power Supply Conditioner, and Digital Interface.

CONVERTER OPERATION

As shown in FIGURE 1, the converter section of the SD-14531 contains a high accuracy control transformer, demodulator, error processor, voltage-controlled oscillator (VCO), up-down counter, and reference conditioner. The converter produces a digital angle which tracks the analog input angle to within the specified

accuracy of the converter. The control transformer performs the following trigonometric computation:

$$\sin(\theta - \phi) = \sin\theta \cos\phi - \cos\theta \sin\phi$$

Where:

- θ is angle theta representing the resolver shaft position
- φ is digital angle phi contained in the up/down counter

The tracking process consists of continually adjusting φ to make (θ - φ) = 0, so that φ will represent the shaft position θ.

The output of the demodulator is an analog DC level proportional to sin(θ - φ). The error processor receives its input from the demodulator and integrates this sin(θ - φ) error signal which then drives the VCO. The VCO's clock pulses are accumulated by the up/down counter. The velocity voltage accuracy, linearity and offset are determined by the quality of the VCO. Functionally, the up/down counter is an incremental integrator. Therefore, there are two stages of integration which makes the converter a Type II tracking servo.

In a Type II servo, the VCO always settles to a counting rate which makes dφ/dt equal to dθ/dt without lag. The output data will always be fresh and available as long as the maximum tracking rate of the converter is not exceeded.

The reference conditioner is a comparator that produces the square wave reference voltage which drives the demodulator. It's single-ended Input Z is 250k Ohms min, 500k Ohms differential.

SPECIAL FUNCTIONS

The synthesized reference section of the SD-14531 eliminates errors caused by quadrature voltage. Due to the inductive nature of synchros and resolvers, their signals typically lead the reference signal (RH and RL) by about 6°. When an uncompensated reference signal is used to demodulate the control transformer's output, quadrature voltages are not completely eliminated. In a 14-bit converter it is not necessary to compensate for the reference signal's phase shift. A 6° phase shift will, however, cause problems for the one minute accuracy converters. As shown in FIGURE 1, the converter synthesizes its own cos(ωt + α) reference signal from the sinθ - cos(ωt + α), cosθ - cos(ωt + α) signal inputs and from the cosωt reference input. The phase angle of the synthesized reference is determined by the signal input. The reference input is used to choose between the +180° and -180° phases. The synthesized reference will always be exactly in phase with the signal input, and quadrature errors will therefore be eliminated. The synthesized reference circuit also eliminates the 180° false error null hangup.

Quadrature voltages in a resolver or synchro are by definition the resulting 90° fundamental signal in the nulled out error voltage

(e) in the converter. A digital position error will result due to the interaction of this quadrature voltage and a reference phase shift between the converter signal and reference inputs. The magnitude of this error is given by the following formula:

$$\text{Magnitude of Error} = (\text{Quadrature Voltage} / \text{F.S. signal}) \cdot \tan(\alpha)$$

Where:

- Magnitude of Error is in radians,
- Quadrature Voltage is in volts,
- Full Scale signal is in volts,
- α = signal-to-REF phase shift.

An example of the magnitude of error is as follows:

- Let: Quadrature Voltage = 11.8 mV
- Let: F.S. signal = 11.8 V
- Let: $\alpha = 6^\circ$

Then: Magnitude of Error = 0.35 min \cong 1 LSB in the 16th bit.

Note: Quadrature is composed of static quadrature which is specified by the synchro or resolver supplier plus the speed voltage which is determined by the following formula:

$$\text{Speed Voltage} = (\text{rotational speed} / \text{carrier frequency}) \cdot \text{F.S. signal}$$

Where:

- Speed Voltage is the quadrature due to rotation,
- Rotational speed is the rps (rotations per second) of the synchro or resolver,
- Carrier frequency is the REF in Hz.

BUILT-IN-TEST (BIT, PIN 15)

The Built-In-Test output (BIT) monitors the level of error (D) from the demodulator. D represents the difference in the input and output angles and ideally should be zero; if it exceeds approximately 180 LSBs (of the selected resolution) the logic level at BIT will change from a logic 0 to logic 1. This condition will occur during a large step

FIGURE 2. RESOLUTION CONTROL TIMING DIAGRAM

and reset after the converter settles out. BIT will also change to logic 1 for an over-velocity condition, because the converter loop cannot maintain input-output and/or if the converter malfunctions where it cannot maintain the loop at a null. BIT will also be set for a Loss-of-Signal (LOS) and/or a Loss-of-Reference (LOR).

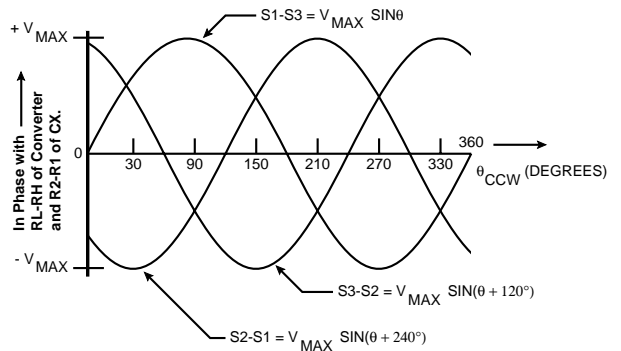

PROGRAMMABLE RESOLUTION (14B, PIN 16)

Resolution is controlled by one logic input, 14B. The resolution can be changed during converter operation so the appropriate resolution and velocity dynamics can be changed as needed. To insure that a race condition does not exist between counting and changing the resolution, input 14B is latched internally on the trailing edge of CB (see FIGURE 2).

INTERFACING - INPUTS

SIGNAL INPUT OPTIONS

The SD-14531 series offers programmable synchro or resolver inputs. In a synchro or resolver, shaft angle data is transmitted as the ratio of carrier amplitudes across the input terminals. Synchro signals, which are of the form $\sin\theta\cos\omega t$, $\sin(\theta+120^\circ)$

Standard Synchro Control Transmitter (CX) Outputs as a Function of CCW Rotation From Electrical Zero (EZ).

Standard Resolver Control Transmitter (RX) Outputs as a Function of CW Rotation From Electrical Zero (EZ) With R2-R4 Excited.

FIGURE 3. SYNCHRO AND RESOLVER SIGNALS

$\cos\omega t$, and $\sin(\theta+240^\circ)\cos\omega t$ are internally converted to resolver format; $\sin\theta\cos\omega t$ and $\cos\theta\cos\omega t$.

FIGURE 3 illustrates synchro and resolver signals as a function of the angle θ .

The solid-state signal and reference inputs are true differential inputs with high AC and DC common mode rejection. *Input impedance is maintained with power off.*

SYNCHRO/RESOLVER PROGRAMMABLE INPUT OPTION

The Synchro or Resolver Programmable input options are shown in FIGURES 4 and 5.

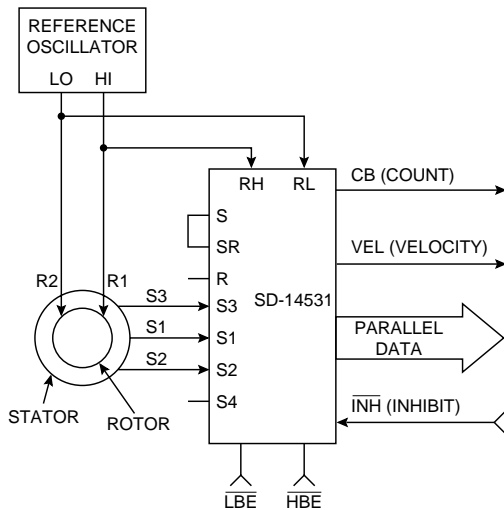

FIGURE 4. SYNCHRO INPUT CONNECTION DIAGRAM

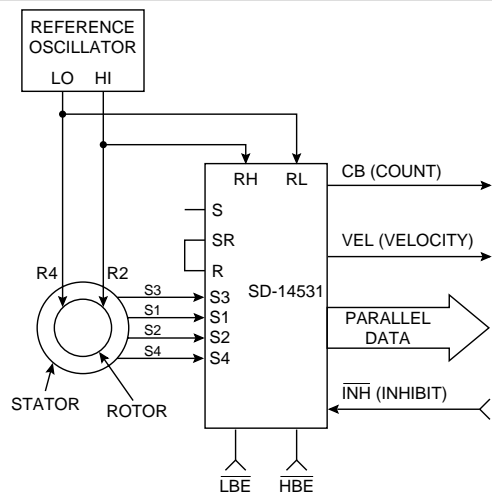

FIGURE 5. RESOLVER INPUT CONNECTION DIAGRAM

SOLID-STATE BUFFER INPUT PROTECTION — TRANSIENT VOLTAGE SUPPRESSION

The solid-state signal and reference inputs are true differential inputs with high AC and DC common rejection, so most applications will not require units with isolation transformers. Input impedance is maintained with power off. The recurrent AC peak + DC common-mode voltage should not exceed the values in TABLE 2.

The 90 V line-to-line systems may have voltage transients which exceed the 500 V specification listed in TABLE 2. *These transients can destroy the thin-film input resistor network in the hybrid.* Therefore, 90 V L-L solid-state input modules may be protected by installing voltage suppressors as shown. Voltage transients are likely to occur whenever synchro or resolver are switched on and off. For instance a 1000 V transient can be generated when the primary of a CX or TX driving a synchro or resolver input is opened (see FIGURE 6).

TABLE 2. COMMON-MODE AND TRANSIENT MAXIMUMS		
INPUT	COMMON-MODE MAXIMUM	MAX. TRANSIENT PEAK VOLTAGE
11.8 VL-L	30 V Peak	150 V
90 VL-L	180 V Peak	500 V
Reference	250 V Peak	500 V
1 VL-L	—	100 V

CR1, CR2, and CR3 are SA150CA, bipolar transient voltage suppressors or equivalent.

CR4 and CR5 are SA150CA, bipolar transient voltage suppressors or equivalent.

FIGURE 6. CONNECTIONS FOR VOLTAGE TRANSIENT SUPPRESSORS

TRANSFORMER ISOLATION

Many applications require electrical isolation to the input of the converter. DDC offers transformers suitable for these applications, as indicated in TABLE 8. These transformers are connected as shown in FIGURES 21 and 22.

INTERFACING - DIGITAL OUTPUTS AND CONTROLS

DIGITAL INTERFACE

The digital interface circuitry performs three main functions:

1. Latches the output bits during an Inhibit ($\overline{\text{INH}}$) command allowing stable data to be read out of the SD-14531.
2. Furnishes parallel tri-state data formats.
3. Acts as a buffer between the internal CMOS logic and the external TTL logic.

In the SD-14531 applying an Inhibit ($\overline{\text{INH}}$) command will lock the data in the inhibit transparent latch without interfering with the continuous tracking of the converter's feedback loop. Therefore the digital angle ϕ is always updated, and the $\overline{\text{INH}}$ can be applied for an arbitrary amount of time. The Inhibit Transparent Latch and the 50 ns delay are part of the inhibit circuitry. For further information see the ***INHIBIT ($\overline{\text{INH}}$, PIN 13)*** paragraph.

DIGITAL ANGLE OUTPUTS (LOGIC INPUT/OUTPUT)

The digital angle outputs are buffered and provided in a two-byte format. The first byte contains the MSBs (bits 1-8) and is enabled by placing $\overline{\text{HBE}}$ (pin 35) to a logic 0. Depending on the user-programmed resolution, the second byte contains the LSBs and is enabled by placing $\overline{\text{LBE}}$ (pin 17) to a logic 0.

The second byte will contain either bits 9-14 (14-bit resolution) or bits 9-16 (16-bit resolution). All unused LSB's will be at logic 0. TABLE 3 lists the angular weight for the digital angle outputs.

The digital angle outputs are valid 150 ns after $\overline{\text{HBE}}$ or $\overline{\text{LBE}}$ are activated with a logic 0 and are high impedance within 100 ns, max after $\overline{\text{HBE}}$ and $\overline{\text{LBE}}$ are set to logic 1 (See FIGURE 7). Both enables are internally pulled down.

DIGITAL ANGLE OUTPUT TIMING

The digital angle output is 14 or 16 parallel data bits and Converter Busy (CB). All logic outputs are short-circuit proof to ground and +5 V. The CB output is a positive, 0.8 to 3.0 μs pulse.

The digital output data changes approximately 50 ns after the leading edge of the CB pulse because of an internal delay. Data is valid 0.2 μs after the leading edge of CB (See FIGURE 8). The

angle is determined by the sum of the bits at logic 1. The digital outputs are valid 150 ns max after $\overline{\text{HBE}}$ or $\overline{\text{LBE}}$ go low and are high impedance within 100 ns max of $\overline{\text{HBE}}$ or $\overline{\text{LBE}}$ going high.

INHIBIT ($\overline{\text{INH}}$, PIN 13)

When an Inhibit ($\overline{\text{INH}}$) input is applied to the SD-14531, the Output Transparent Latch is locked causing the output data bits to remain stable while data is being transferred (See FIGURE 9). The output data bits are stable 0.5 μs after $\overline{\text{INH}}$ goes to logic 0.

A logic 0 at the T input of the Inhibit Transparent Latch latches the data, and a logic 1 applied to T allows the bits to change. This latch also prevents the transmission of invalid data when there is an overlap between CB and $\overline{\text{INH}}$. While the counter is not being updated, CB is at logic 0 and the $\overline{\text{INH}}$ latch is transparent; when CB goes to logic 1, the $\overline{\text{INH}}$ latch is locked. If CB occurs after $\overline{\text{INH}}$ has been applied, the latch will remain locked and its data will not change until CB returns to logic 0; if $\overline{\text{INH}}$ is applied during CB, the latch will not lock until the CB pulse is over. The purpose of the 50 ns delay is to prevent a race condition between CB and $\overline{\text{INH}}$ where the up-down counter begins to change as an $\overline{\text{INH}}$ is applied.

An $\overline{\text{INH}}$ input, regardless of its duration, does not affect the converter update. A simple method of interfacing to a computer asynchronous to CB is: (1) Apply $\overline{\text{INH}}$; (2) Wait 0.5 μs min; (3) Transfer the data; (4) Release $\overline{\text{INH}}$.

A logic 1 for the $\overline{\text{INH}}$ enables the output data to be updated. The time it takes for $\overline{\text{INH}}$ to go to a logic 1 should be 100 ns minimum before valid data is transferred. To allow the update of the output data with valid information the $\overline{\text{INH}}$ must remain at a logic 1 for 1 μs minimum (See FIGURE 10).

DATA TRANSFERS

Digital output data from the SD-14531 can be transferred to 8-bit and 16-bit bus systems. For 8-bit systems, the MSB and LSB bytes are transferred sequentially. For 16-bit systems all bits are transferred at the same time

DATA TRANSFER TO 8-BIT BUS

FIGURES 11 and 12 show the connections and timing for transferring data from the SD-14531 to an 8-bit bus.

As can be seen by the timing diagram, the following occurs:

1. The converter $\overline{\text{INH}}$ control is applied and must remain low for a minimum of 500 ns before valid data is transferred.
2. $\overline{\text{HBE}}$ is set to a low state (logic 0) 350 ns MIN after $\overline{\text{INH}}$ goes low and must remain low for a minimum of 150 ns before the MSB data (1-8) is valid and transferred.

3. As $\overline{\text{HBE}}$ is set to a high state (logic 1), $\overline{\text{LBE}}$ is brought low for a 150 ns MIN before the LSB data is valid and transferred.
4. $\overline{\text{LBE}}$ should go high (to logic 1) at least 100 ns MAX before another device uses the bus.

5. $\overline{\text{INH}}$ goes high and data transfer is done and the data refresh cycle can begin. Note the time it takes for $\overline{\text{INH}}$ to go to a logic 1 should be 100 ns minimum before valid data is transferred.

TABLE 3. DIGITAL ANGLE OUTPUTS		
BIT	DEG/BIT	MIN/BIT
1(MSB ALL MODES)	180	10800
2	90	5400
3	45	2700
4	22.5	1350

FIGURE 9. INHIBIT TIMING DIAGRAM

FIGURE 8. CONVERTER BUSY TIMING DIAGRAM

FIGURE 10. OUTPUT DATA UPDATE TIMING

Note: For further understanding refer to the beginning of this section (i.e., Digital Interface, Digital Angle Outputs, Digital Angle Output Timing, and Inhibit).

DATA TRANSFER TO 16-BIT BUS

Data transfer to the 16-bit bus is much simpler than the 8-bit bus. FIGURES 13 and 14 show the connections and timing for transferring data from the SD-14531 to a 16-bit bus.

As can be seen by the timing diagram the following occurs:

1. The converter \overline{INH} control is applied and must remain low for a minimum of 500 ns before valid data is transferred.
2. \overline{HBE} and \overline{LBE} are set to a low state (logic 0) 350 ns minimum after \overline{INH} goes low and must remain low for a minimum of 150 ns before the data (1-16) is valid and transferred.
3. \overline{HBE} and \overline{LBE} should go high (to logic 1) at least 100 ns MAX before another device uses the bus.
4. \overline{INH} goes high and data transfer is done and the data refresh cycle can begin. Note the time it takes for \overline{INH} to go to a logic 1 should be 100 ns minimum before valid data is transferred.

Note: For further understanding refer to the beginning of this section (i.e., Digital Interface, Digital Angle Outputs, Digital Angle Output Timing, and Inhibit).

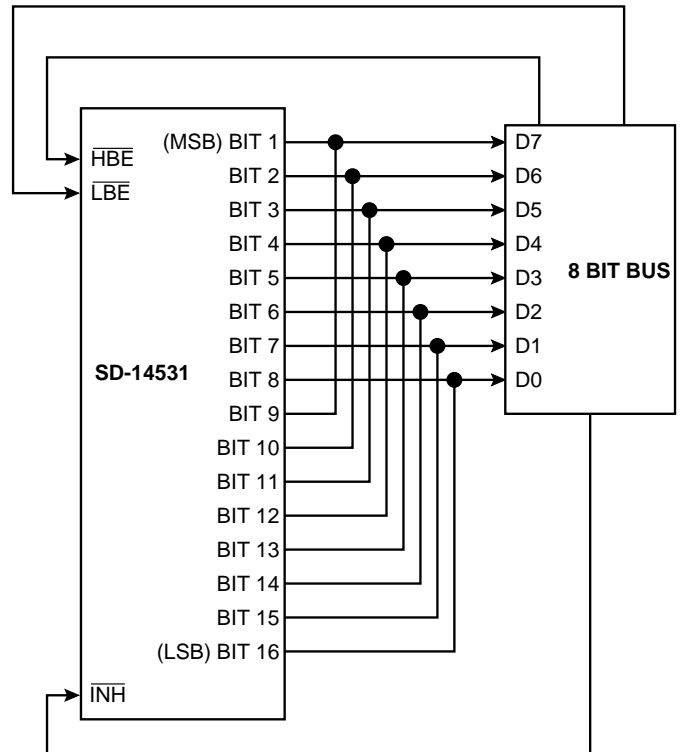

FIGURE 11. 8-BIT DATA TRANSFER

INTERFACING - ANALOG OUTPUTS

The analog outputs are AC error (e), Analog Return (V), and Velocity (VEL).

AC ERROR (e, PIN 12)

The AC error is proportional to the difference between the input angle θ and the digital input angle ϕ , $(\theta - \phi)$, with a scaling of:

- 3.5 mV rms/LSB (14-bit mode)
- 1.75 mV rms/LSB (16-bit mode)

The e output can swing ± 3 V min with respect to Analog Return (V).

ANALOG RETURN (V, PIN 11)

This internal voltage is not required externally for normal operation of the converter. It is used as the internal DC reference and the return for the VEL and e outputs. It is nominally +4.3 V and is proportional to the +5 V DC supply.

VELOCITY (VEL, PIN 10)

The velocity output (VEL, pin 10) is a DC voltage proportional to angular velocity $d\theta/dt$. The velocity is the input to the voltage-controlled oscillator (VCO), as shown in FIGURE 1. Its linearity

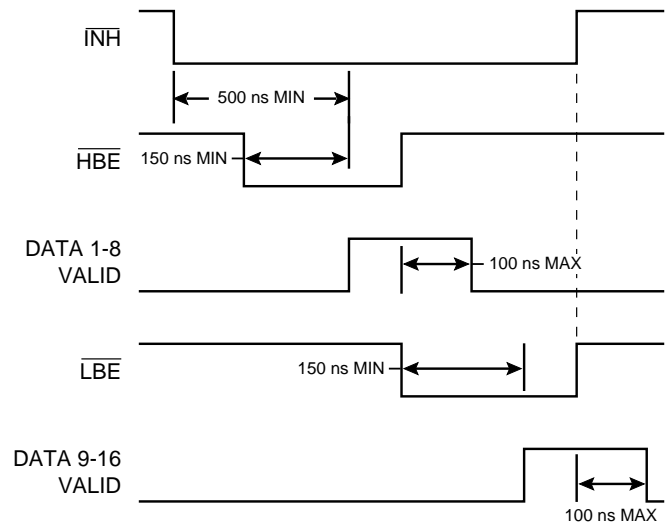

FIGURE 12. 8-BIT DATA TRANSFER TIMING

and accuracy are dependent solely on the linearity and accuracy of the VCO.

The VEL output can swing ± 1.10 V with respect to Analog Return (V). The analog output VEL characteristics are listed in TABLES 4 and 5.

The VEL output has DC tachometer quality specs such that it can be used as the velocity feedback in servo applications.

INTERFACING - DYNAMIC PERFORMANCE

A Type II servo loop ($K_v = \infty$) and very high acceleration constants give the SD-14531 superior dynamic performance. If the power supply voltage is not the +5 V DC nominal value, the specified input rates will increase or decrease in proportion to the fractional change in voltage.

TRANSFER FUNCTIONS

The dynamic performance of the converter can be determined from its transfer function block diagram (FIGURE 15) and open and closed loop Bode plots (FIGURES 16 and 17). Values for the transfer function block can be obtained from TABLE 6.

RESPONSE PARAMETERS

As long as the converter's maximum tracking rate is not exceeded, there will be no velocity lag in the converter output although momentary acceleration errors remain. If a step input occurs, as

when the power is initially applied, the response will be critically damped. FIGURE 18 shows the response to a step input. After initial slewing at the maximum tracking rate of the converter, there is one overshoot (which is inherent in a Type II servo). The overshoot settling to a final value is a function of the small signal settling time.

FASTER SETTLING TIME USING "BIT" TO REDUCE RESOLUTION

Since the SD-14531 has higher precision in the 16-bit mode and faster settling in the 14-bit mode, the BIT output can be used to

TABLE 4. VELOCITY CHARACTERISTICS					
PARAMETER	UNITS	TYP		MAX

Load	mA	0.5	0.5	0.5	0.5

Note: With respect to Analog Return (V)

TABLE 5. VELOCITY VOLTAGE SCALING (values in V/rps)		
DEVICE TYPE	14 BIT	16 BIT
60 Hz	0.56	2.23
400 Hz	0.11	0.44

Note: If the resolution is changed while the input is changing, then the velocity output voltage and the digital output will have a transient until it settles to the new velocity scaling at a speed determined by the bandwidth.

FIGURE 13. 16-BIT DATA TRANSFER

FIGURE 14. 16-BIT DATA TRANSFER TIMING

program the SD-14531 for lower resolution, allowing the converter to settle faster for step inputs. High precision, faster settling can therefore be obtained simultaneously and automatically in one unit.

CONNECTING THE SD-14531 TO A P.C. BOARD

The SD-14531 can be attached to a printed circuit board using hand solder or wave soldering techniques. Limit exposure to 300°C (572°F) max, for 10 seconds maximum.

Since the SD-14531 Series converters contain a CMOS device, standard CMOS handling procedures should be followed.

TABLE 7. SD-14531 PINOUTS

PIN	FUNCTION			PIN	FUNCTION
1	S1(Res)	S1(Syn)	-----	36	+5 V
2	S2(Res)	S2(Syn)	Cos(x)	35	HBE
3	S3(Res)	S3(Syn)	Sin(x)	34	B1 (MSB)
4	S4(Res)	-----	-----	33	B2
5	S(Res)	S(Syn)	N/C(x)	32	B3
6	SR(Res)	SR(Syn)	N/C(x)	31	B4
7	R(Res)	R(Syn)	N/C(x)	30	B5
8		RL		29	B6
9		RH		28	B7
10		VEL		27	B8
11	Analog Return (V)			26	B9
12		e		25	B10
13		INH		24	B11
14		CB		23	B12
15		BIT		22	B13
16		14B		21	B14
17		LBE		20	B15
18		GND		19	B16 (LSB)

Note: "(Res)" means resolver, "(Syn)" means synchro, and "(x)" means direct. For a direct input unit pins 5, 6, and 7 (S, SR, R) are no connect.

- NOTES:
- Dimensions shown are in inches (mm).
 - Lead identification numbers are for reference only.
 - Lead cluster shall be centered within ± 0.01 (0.25) of outline dimensions. Lead spacing dimensions apply only at seating plane.
 - Package is kovar with electroless nickel plating.
 - Case is electrically floating.
 - Leads are gold coated kovar.

FIGURE 19. SD-14531 MECHANICAL OUTLINE 36-PIN DDIP (KOVAR)

- NOTES:
- Dimensions shown are in inches (mm).
 - Lead Cluster to be centralized about case centerline within ± 0.10 .

2. SCHEMATIC DIAGRAMS

400 Hz REFERENCE TRANSFORMER DIAGRAMS (T2)

1. MECHANICAL OUTLINE

2. SCHEMATIC DIAGRAM

60 Hz SYNCHRO AND REFERENCE TRANSFORMER DIAGRAMS

The mechanical outline is the same for the synchro input transformer (24126) and the reference input transformer (24133), except for the pins. Pins for the reference transformer are shown in parenthesis () below. An asterisk * indicates that the pin is omitted.

ORDERING INFORMATION

(see TABLE 8 for reference and signal transformer ordering information)

SD-14531XX-XXXX

Supplemental Process Requirements:

- S = Pre-Cap Source Inspection
- L = Pull Test
- Q = Pull Test and Pre-Cap Inspection
- K = One Lot Date Code
- W = One Lot Date Code and PreCap Source
- Y = One Lot Date Code and 100% Pull Test
- Z = One Lot Date Code, PreCap Source and 100% Pull Test
- Blank = None of the Above

Accuracy:

- 2 = ± 5.2 Minutes
- 4 = ± 2.6 Minutes
- 5 = ± 1.3 Minutes Resolver Mode, ± 1.6 Minutes Synchro Mode (16-Bit Mode only)

Process Requirements:

- 0 = Standard DDC Processing, no Burn-In (See table below.)
- 1 = MIL-PRF-38534 Compliant
- 2 = B*
- 3 = MIL-PRF-38534 Compliant with PIND Testing
- 4 = MIL-PRF-38534 Compliant with Solder Dip
- 5 = MIL-PRF-38534 Compliant with PIND Testing and Solder Dip
- 6 = B* with PIND Testing
- 7 = B* with Solder Dip
- 8 = B* with PIND Testing and Solder Dip
- 9 = Standard DDC Processing with Solder Dip, no Burn-In (See table below.)

Temperature Grade/Data Requirements:

- 1 = -55°C to +125°C
- 2 = -40°C to +85°C
- 3 = 0°C to +70°C
- 4 = -55°C to +125°C with Variables Test Data
- 5 = -40°C to +85°C with Variables Test Data
- 8 = 0°C to +70°C with Variables Test Data

Input:

- 1 = 11.8/400 Hz
- 2 = 90/400 Hz
- 3 = 90/60 Hz
- 4 = Direct/400 Hz
- 5 = Direct/60 Hz

Package:

- D = DIP
- F = Flat Pack (Consult factory for availability.)

*Standard DDC Processing with burn-in and full temperature test — see table below.

STANDARD DDC PROCESSING		
TEST	MIL-STD-883	
	METHOD(S)	CONDITION(S)
INSPECTION	2009, 2010, 2017, and 2032	—
SEAL	1014	A and C
TEMPERATURE CYCLE	1010	C
CONSTANT ACCELERATION	2001	A
BURN-IN	1015, Table 1	—

TABLE 8. TRANSFORMER ORDERING INFORMATION					
TYPE	FREQ.	REF. VOLTAGE	L-L VOLTAGE	PART NUMBERS	
				REF. XFMR	SIGNAL XFMR
Synchro	400 Hz	115 V	90 V	21049	21045*
Synchro	400 Hz	26 V	11.8 V	21049	21045*
Resolver	400 Hz	115 V	90 V	21049	21048*
Resolver	400 Hz	26 V	26 V	21049	21047*
Resolver	400 Hz	26 V	11.8 V	21049	21046*
Synchrot†	60 Hz	115 V	90 V	24133-1 24133-3	24126-1 24126-3

* The part number for each 400 Hz synchro or resolver isolation transformer includes two separate modules as shown in the outline drawings.

† 60 Hz synchro transformers are available in two temperature ranges:
 XXXXX-1 = -55 °C to +105 °C
 XXXXX-3 = 0 °C to +70 °C
