

December 1992

CMOS Decade Counter/Divider

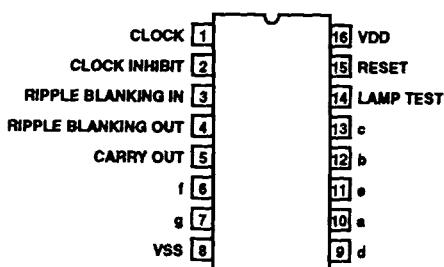

Features

- High Voltage Types (20V Rating)
- Decoded 7 Segment Display Outputs and Ripple Blanking
- Counter and 7 Segment Decoding In One Package
- Easily Interfaced with 7 Segment Display Types
- Fully Static Counter Operation DC to 6MHz (typ.) at VDD = 10V
- Ideal for Low-Power Displays
- "Ripple Blanking" and Lamp Test
- 100% Tested for Quiescent Current at 20V
- Standardized Symmetrical Output Characteristics
- 5V, 10V and 15V Parametric Ratings
- Schmitt-Triggered Clock Inputs
- Meets All Requirements of JEDEC Tentative Standards No. 13B, "Standard Specifications for Description of "B" Series CMOS Device's

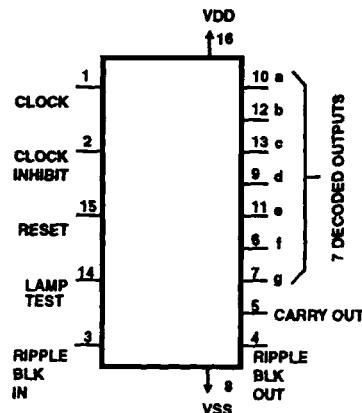

Applications

- Decade Counting 7 Segment Decimal Display
- Frequency Division 7 Segment Decimal Displays
- Clocks, Watches, Timers (e.g. + 60, + 60, +12 Counter/Display)
- Counter/Display Driver For Meter Applications

File Number 3301

The CD4033BMS has provisions for automatic blanking of the non-significant zeros in a multi-digit decimal number which results in an easily readable display consistent with normal writing practice. For example, the number 0050.0700 in an eight digit display would be displayed as 50.07. Zero suppression on the integer side is obtained by connecting the RBI terminal of the CD4033BMS associated with the most significant digit in the display to a low-level voltage and connecting the RBO terminal of that stage to the RBI terminal of the CD4033BMS in the next-lower significant position in the display. This procedure is continued for each succeeding CD4033BMS on the integer side of the display.

On the fraction side of the display the RBI of the CD4033BMS associated with the least significant bit is connected to a low-level voltage and the RBO of that CD4033BMS is connected to the RBI terminal of the CD4033BMS in the next more-significant-bit position. Again, this procedure is continued for all CD4033BMS's on the fraction side of the display.

In a purely fractional number the zero immediately preceding the decimal point can be displayed by connecting the RBI of that stage to a high level voltage (instead of to the RBO of the next more-significant-stage). For example: optional zero → 0.7346. Likewise, the zero in a number such as 763.0 can be displayed by connecting the RBI of the CD4033BMS associated with it to a high-level voltage.

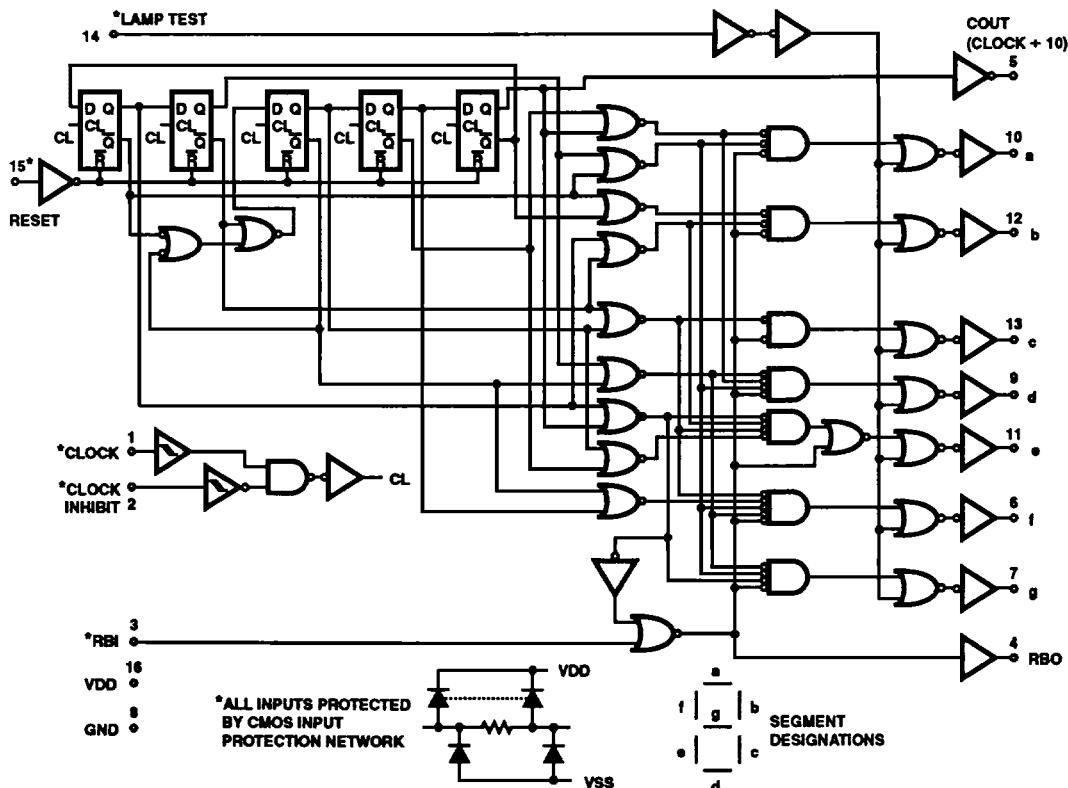

Ripple blanking of non-significant zeros provides an appreciable savings in display power.

The CD4033BMS has a LAMP TEST input which, when connected to a high-level voltage, overrides normal decoder operation and enables a check to be made on possible display malfunctions by putting the seven outputs in the high state.

The CD4033BMS are supplied in these 16 lead outline packages:

Braze Seal DIP	H4W
Frit Seal DIP	H2R
Ceramic Flatpack	H6W
