## Electrical Characteristics

The following sections describe the operating conditions and power consumption of Cyclone V devices.

## Operating Conditions

Cyclone V devices are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of the Cyclone V devices, you must consider the operating requirements described in this section.

## Absolute Maximum Ratings

This section defines the maximum operating conditions for Cyclone V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms.

The functional operation of the device is not implied for these conditions.

**Caution:** Conditions outside the range listed in the following table may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

**Table 1: Absolute Maximum Ratings for Cyclone V Devices**

Symbol	Description	Minimum	Maximum	Unit
$V_{CC}$	Core voltage and periphery circuitry power supply	-0.5	1.43	V
$V_{CCPGM}$	Configuration pins power supply	-0.5	3.90	V
$V_{CC\_AUX}$	Auxiliary supply	-0.5	3.25	V
$V_{CCBAT}$	Battery back-up power supply for design security volatile key register	-0.5	3.90	V
$V_{CCPD}$	I/O pre-driver power supply	-0.5	3.90	V
$V_{CCIO}$	I/O power supply	-0.5	3.90	V

$V_{CC\_AUX\_SHARED}^{(1)}$	HPS auxiliary power supply	-0.5	3.25	V
$I_{OUT}$	DC output current per pin	-25	40	mA

<sup>(1)</sup>  $V_{CC\_AUX\_SHARED}$  must be powered by the same source as  $V_{CC\_AUX}$  for Cyclone V SX C5, C6, D5, and D6 devices, and Cyclone V SE A5 and A6 devices.

Symbol	Description	Minimum	Maximum	Unit
$T_J$	Operating junction temperature	-55	125	°C
$T_{STG}$	Storage temperature (no bias)	-65	150	°C

### Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage listed in the following table and undershoot to  $-2.0$  V for input currents less than 100 mA and periods shorter than 20 ns.

The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle.

For example, a signal that overshoots to 4.00 V can only be at 4.00 V for ~15% over the lifetime of the device; for a device lifetime of 10 years, this amounts to 1.5 years.

**Table 2: Maximum Allowed Overshoot During Transitions for Cyclone V Devices**

This table lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime.

Symbol	Description	Condition (V)	Overshoot Duration as % of High Time	Unit

<sup>(2)</sup> The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

<sup>(7)</sup> This is also applicable to HPS power supply. For HPS power supply, refer to t<sub>RAMP</sub> specifications for standard POR when HPS\_PORSEL = 0 and t<sub>RAMP</sub> specifications for fast POR when HPS\_PORSEL = 1.

<sup>(8)</sup> The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

<sup>(9)</sup> Altera recommends increasing the V<sub>CCE\_GXBL</sub> and V<sub>CCL\_GXBL</sub> typical value from 1.1 V to 1.2 V for Cyclone V GT and ST FPGA systems which require full compliance to the PCIe Gen2 transmit jitter specification. For more information about the maximum full duplex channels recommended in Cyclone V GT and ST devices under this condition, refer to the Transceiver Protocol Configurations in Cyclone V Devices chapter.

<sup>(10)</sup> Altera recommends increasing the V<sub>CCE\_GXBL</sub> and V<sub>CCL\_GXBL</sub> typical value from 1.1 V to 1.2 V for full compliance to CPRI transmit jitter specification at 4.9152 Gbps ( Cyclone V GT and ST devices) and 6.144Gbps ( Cyclone V GT and ST devices only). For more information about the maximum full duplex channels recommended in Cyclone V GT and ST devices for CPRI 6.144 Gbps, refer to the Transceiver Protocol Configurations in Cyclone V Devices chapter.

## DC Characteristics

### Supply Current and Power Consumption

Altera offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Quartus® Prime PowerPlay Power Analyzer feature.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the resources you use.

The Quartus Prime PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

Figure 1: Equation for OCT Variation Without Recalibration

$$R_{OCT} = R_{SCAL} \left( 1 + \left\langle \frac{dR}{dT} \times \Delta T \right\rangle \pm \left\langle \frac{dR}{dV} \times \Delta V \right\rangle \right)$$

The definitions for the equation are as follows:

- The  $R_{OCT}$  value calculated shows the range of OCT resistance with the variation of temperature and  $V_{CCIO}$ .
- $R_{SCAL}$  is the OCT resistance value at power-up.
- $\Delta T$  is the variation of temperature with respect to the temperature at power up.
- $\Delta V$  is the variation of voltage with respect to the  $V_{CCIO}$  at power up.
- $dR/dT$  is the percentage change of  $R_{SCAL}$  with temperature.
- $dR/dV$  is the percentage change of  $R_{SCAL}$  with voltage.

### OCT Variation after Power-Up Calibration

**Table 10: OCT Variation after Power-Up Calibration for Cyclone V Devices**

This table lists OCT variation with temperature and voltage after power-up calibration. The OCT variation is valid for a  $V_{CCIO}$  range of  $\pm 5\%$  and a temperature range of  $0^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .

Symbol	Description	$V_{CCIO}$ (V)	Value	Unit

Symbol	Description	Value	Unit
$C_{IOTB}$	Input capacitance on top and bottom I/O pins	6	pF
$C_{IOLR}$	Input capacitance on left and right I/O pins	6	pF
$C_{OUTFB}$	Input capacitance on dual-purpose clock output and feedback pins	6	pF

## Hot Socketing

**Table 12: Hot Socketing Specifications for Cyclone V Devices**

Symbol	Description	Maximum	Unit
$I_{IOPIN} (DC)$	DC current per I/O pin	300	$\mu A$
$I_{IOPIN} (AC)$	AC current per I/O pin	8 <sup>(15)</sup>	mA
$I_{XCVR-TX} (DC)$	DC current per transceiver transmitter (TX) pin	100	mA
$I_{XCVR-RX} (DC)$	DC current per transceiver receiver (RX) pin	50	mA

## Internal Weak Pull-Up Resistor

All I/O pins, except configuration, test, and JTAG pins, have an option to enable weak pull-up.

<sup>(15)</sup> The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns,  $|I_{IOPIN}| = C dv/dt$ , in which C is the I/O pin capacitance and dv/dt is the slew rate.

**Table 13: Internal Weak Pull-Up Resistor Values for Cyclone V Devices**

Symbol	Description	Condition (V) <sup>(16)</sup>	Value <sup>(17)</sup>	Unit
R <sub>PU</sub>	Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if you have enabled the programmable pull-up resistor option.	V <sub>CCIO</sub> = 3.3 ±5%	25	kΩ

**I/O Standard Specifications**

Tables in this section list the input voltage (V<sub>IH</sub> and V<sub>IL</sub>), output voltage (V<sub>OH</sub> and V<sub>OL</sub>), and current drive characteristics (I<sub>OH</sub> and I<sub>OL</sub>) for various I/O standards supported by Cyclone V devices.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

<sup>(16)</sup> Pin pull-up resistance values may be lower if an external source drives the pin higher than V<sub>CCIO</sub>.

<sup>(17)</sup> Valid with ±10% tolerances to cover changes over PVT.

<sup>(41)</sup> The AC coupled  $V_{ICM}$  is 650 mV for PCIe mode only.

<sup>(42)</sup>  $t_{LTR}$  is the time required for the receive clock data recovery (CDR) to lock to the input reference clock frequency after coming out of reset.

<sup>(43)</sup>  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the `rx_is_lockedto data` signal goes high.

### Transmitter Pre-Emphasis Levels

The following table lists the simulation data on the transmitter pre-emphasis levels in dB for the first post tap under the following conditions:

- Low-frequency data pattern—five 1s and five 0s
- Data rate—2.5 Gbps

The levels listed are a representation of possible pre-emphasis levels under the specified conditions only and the pre-emphasis levels may change with data pattern and data rate.

Cyclone V devices only support 1st post tap pre-emphasis with the following conditions:

- The 1st post tap pre-emphasis settings must satisfy  $|B| + |C| \leq 60$  where  $|B| = V_{OD}$  setting with termination value,  $R_{TERM} = 100 \Omega$  and  $|C| = 1st$  post tap pre-emphasis setting.
- $|B| - |C| > 5$  for data rates  $< 5$  Gbps and  $|B| - |C| > 8.25$  for data rates  $> 5$  Gbps.
- $(V_{MAX}/V_{MIN} - 1)\% < 600\%$ , where  $V_{MAX} = |B| + |C|$  and  $V_{MIN} = |B| - |C|$ .

<sup>(48)</sup> Convert these values to their binary equivalent form if you are using the dynamic reconfiguration mode for PMA analog controls.

<sup>(49)</sup> Only valid for data rates  $\leq 5$  Gbps.

Exception for PCIe Gen2 design:

- $V_{OD}$  setting = 50 and pre-emphasis setting = 22 are allowed for PCIe Gen2 design with transmit de-emphasis -6dB setting (`pipe_txdeemp = 1'b0`) using Altera PCIe Hard IP and PIPE IP cores.
- $V_{OD}$  setting = 50 and pre-emphasis setting = 12 are allowed for PCIe Gen2 design with transmit de-emphasis -3.5dB setting (`pipe_txdeemp = 1'b1`) using Altera PCIe Hard IP and PIPE IP cores.

For example, when  $V_{OD} = 800$  mV, the corresponding  $V_{OD}$  value setting is 40. The following conditions show that the 1st post tap pre-emphasis setting = 2 is valid:

- $|B| + |C| \leq 60 \rightarrow 40 + 2 = 42$
- $|B| - |C| > 5 \rightarrow 40 - 2 = 38$
- $(V_{MAX}/V_{MIN} - 1)\% < 600\% \rightarrow (42/38 - 1)\% = 10.52\%$

To predict the pre-emphasis level for your specific data rate and pattern, run simulations using the Cyclone V HSSI HSPICE models.

Peripheral clock	155	155	155	MHz

## PLL Specifications

**Table 30: PLL Specifications for Cyclone V Devices**

This table lists the Cyclone V PLL block specifications. Cyclone V PLL block does not include HPS PLL.

Symbol	Parameter	Condition	Min	Typ	Max	Unit
$f_{IN}$	Input clock frequency	-C6 speed grade	5	—	670 <sup>(52)</sup>	MHz
		-C7, -I7 speed grades	5	—	622 <sup>(52)</sup>	MHz
		-C8, -A7 speed grades	5	—	500 <sup>(52)</sup>	MHz
$f_{INPFD}$	Integer input clock frequency to the phase frequency detector (PFD)	—	5	—	325	MHz
$f_{FINPFD}$	Fractional input clock frequency to the PFD	—	50	—	160	MHz
$f_{VCO}$ <sup>(53)</sup>	PLL voltage-controlled oscillator (VCO) operating range	-C6, -C7, -I7 speed grades	600	—	1600	MHz
		-C8, -A7 speed grades	600	—	1300	MHz
$t_{EINDUTY}$	Input clock or external feedback clock input duty cycle	—	40	—	60	%
$f_{OUT}$	Output frequency for internal global or regional clock	-C6, -C7, -I7 speed grades	—	—	550 <sup>(54)</sup>	MHz
		-C8, -A7 speed grades	—	—	460 <sup>(54)</sup>	MHz

<sup>(52)</sup> This specification is limited in the Quartus Prime software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

<sup>(53)</sup> The VCO frequency reported by the Quartus Prime software takes into consideration the VCO post-scale counter  $\kappa$  value. Therefore, if the counter  $\kappa$  has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.

<sup>(54)</sup> This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $F_{OUT}$  of the PLL.

Symbol	Parameter	Condition	Min	Typ	Max	Unit
$f_{\text{OUT\_EXT}}$	Output frequency for external clock output	-C6, -C7, -I7 speed grades	—	—	667 <sup>(54)</sup>	MHz
		-C8, -A7 speed grades	—	—	533 <sup>(54)</sup>	MHz
$t_{\text{OUTDUTY}}$	Duty cycle for external clock output (when set to 50%)	—	45	50	55	%
$t_{\text{FCOMP}}$	External feedback clock compensation time	—	—	—	10	ns
$t_{\text{DYCONFIGCLK}}$	Dynamic configuration clock for <code>mgmt_clk</code> and <code>scanclk</code>	—	—	—	100	MHz
$t_{\text{LOCK}}$	Time required to lock from end-of-device configuration or deassertion of <code>areset</code>	—	—	—	1	ms
$t_{\text{DLOCK}}$	Time required to lock dynamically (after switchover or reconfiguring any non-post-scale counters/delays)	—	—	—	1	ms
$f_{\text{CLBW}}$	PLL closed-loop bandwidth	Low	—	0.3	—	MHz
		Medium	—	1.5	—	MHz
		High <sup>(55)</sup>	—	4	—	MHz
$t_{\text{PLL\_PSERR}}$	Accuracy of PLL phase shift	—	—	—	±50	ps
$t_{\text{ARESET}}$	Minimum pulse width on the <code>areset</code> signal	—	10	—	—	ns
$t_{\text{INCCJ}}$ <sup>(56)(57)</sup>	Input clock cycle-to-cycle jitter	$F_{\text{REF}} \geq 100$ MHz	—	—	0.15	UI (p-p)
		$F_{\text{REF}} < 100$ MHz	—	—	±750	ps (p-p)

<sup>(55)</sup> High bandwidth PLL settings are not supported in external feedback mode.

<sup>(56)</sup> A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source with jitter < 120 ps.

<sup>(57)</sup>  $F_{\text{REF}}$  is  $f_{\text{IN}}/N$ , specification applies when  $N = 1$ .

Symbol	Parameter	Condition	Min	Typ	Max	Unit

## Memory Block Performance Specifications

To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL and set to 50% output duty cycle. Use the Quartus Prime software to report timing for the memory block clocking schemes.

When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in  $f_{MAX}$ .

## Periphery Performance

This section describes the periphery performance, high-speed I/O, and external memory interface.

Actual achievable frequency depends on design and system specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

## High-Speed I/O Specifications

**Table 33: High-Speed I/O Specifications for Cyclone V Devices**

When J = 1 or 2, bypass the serializer/deserializer (SERDES) block.

For LVDS applications, you must use the PLLs in integer PLL mode. This is achieved by using the LVDS clock network.

The Cyclone V devices support the following output standards using true LVDS output buffer types on all I/O banks.

- True RSDS output standard with data rates of up to 360 Mbps
- True mini-LVDS output standard with data rates of up to 400 Mbps

Symbol		Condition	-C6			-C7, -I7			-C8, -A7			Unit

<sup>(63)</sup> Clock boost factor (W) is the ratio between the input data rate and the input clock rate.

<sup>(64)</sup> The  $F_{\text{max}}$  specification is based on the fast clock used for serial data. The interface  $F_{\text{max}}$  is also dependent on the parallel clock domain which is design dependent and requires timing analysis.

<sup>(65)</sup> The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

<sup>(66)</sup> The maximum ideal data rate is the SERDES factor (J) × PLL max output frequency ( $f_{\text{out}}$ ), provided you can close the design timing and the signal integrity simulation is clean. You can estimate the achievable maximum data rate by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and receiver sampling margin to determine the maximum data rate supported.

<sup>(67)</sup> You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine the leftover timing margin.

## Memory Output Clock Jitter Specifications

**Table 36: Memory Output Clock Jitter Specifications for Cyclone V Devices**

The memory output clock jitter measurements are for 200 consecutive clock cycles, as specified in the JEDEC DDR2/DDR3 SDRAM standard.

The memory output clock jitter is applicable when an input jitter of 30 ps (p-p) is applied with bit error rate (BER)  $10^{-12}$ , equivalent to 14 sigma.

Altera recommends using the UniPHY intellectual property (IP) with PHYCLK connections for better jitter performance.

### HPS PLL Input Jitter

Use the following equation to determine the maximum input jitter (peak-to-peak) the HPS PLLs can tolerate. The divide value (N) is the value programmed into the denominator field of the VCO register for each PLL. The PLL input reference clock is divided by this value. The range of the denominator is 1 to 64.

$$\text{Maximum input jitter} = \text{Input clock period} \times \text{Divide value (N)} \times 0.02$$

## SD/MMC Timing Characteristics

**Table 45: Secure Digital (SD)/MultiMediaCard (MMC) Timing Requirements for Cyclone V Devices**

After power up or cold reset, the Boot ROM uses  $drvsel = 3$  and  $smp1sel = 0$  to execute the code. At the same time, the SD/MMC controller enters the Identification Phase followed by the Data Phase. During this time, the value of interface output clock  $SDMMC\_CLK\_OUT$  changes from a maximum of 400 kHz (Identification Phase) up to a maximum of 12.5 MHz (Data Phase), depending on the internal reference clock  $SDMMC\_CLK$  and the  $CSEL$  setting. The value of  $SDMMC\_CLK$  is based on the external oscillator frequency and has a maximum value of 50 MHz.

After the Boot ROM code exits and control is passed to the preloader, software can adjust the value of  $drvsel$  and  $smp1sel$  via the system manager.  $drvsel$  can be set from 1 to 7 and  $smp1sel$  can be set from 0 to 7. While the preloader is executing, the values for  $SDMMC\_CLK$  and  $SDMMC\_CLK\_OUT$  increase to a maximum of 200 MHz and 50 MHz respectively.

The SD/MMC interface calibration support will be available in a future release of the preloader through the SoC EDS software update.

## NAND Timing Characteristics

**Table 51: NAND ONFI 1.0 Timing Requirements for Cyclone V Devices**

The NAND controller supports Open NAND FLASH Interface (ONFI) 1.0 Mode 5 timing as well as legacy NAND devices. This table lists the requirements for ONFI 1.0 mode 5 timing. The HPS NAND controller can meet this timing by programming the c4 output of the main HPS PLL and timing registers provided in the NAND controller.

## FPP Configuration Timing

### DCLK-to-DATA[] Ratio (r) for FPP Configuration

Fast passive parallel (FPP) configuration requires a different DCLK-to-DATA[] ratio when you turn on encryption or the compression feature.

Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is  $r$  times the DATA[] rate in byte per second (Bps) or word per second (Wps). For example, in FPP  $\times 16$  where the  $r$  is 2, the DCLK frequency must be 2 times the DATA[] rate in Wps.

Cyclone V devices use additional clock cycles to decrypt and decompress the configuration data. If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio - 1) clock cycles after the last data is latched into the Cyclone V device.

**Table 56: DCLK-to-DATA[] Ratio for Cyclone V Devices**

Configuration Scheme	Encryption	Compression	DCLK-to-DATA[] Ratio (r)
FPP (8-bit wide)	Off	Off	1
	On	Off	1
	Off	On	2
	On	On	2
FPP (16-bit wide)	Off	Off	1
	On	Off	2
	Off	On	4
	On	On	4

### FPP Configuration Timing when DCLK-to-DATA[] = 1

When you enable decompression or the design security feature, the DCLK-to-DATA[] ratio varies for FPP  $\times 8$  and FPP  $\times 16$ . For the respective DCLK-to-DATA[] ratio, refer to the DCLK-to-DATA[] Ratio for Cyclone V Devices table.

## Configuration Files

**Table 63: Uncompressed .rbf Sizes for Cyclone V Devices**

Use this table to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal file (.hex) or tabular text file (.ttf) format, have different file sizes.

For the different types of configuration file and file sizes, refer to the Quartus Prime software. However, for a specific version of the Quartus Prime software, any design targeted for the same device has the same uncompressed configuration file size.

The IOCSR raw binary file (.rbf) size is specifically for the Configuration via Protocol (CvP) feature.

## I/O Timing

Altera offers two ways to determine I/O timing—the Excel-based I/O timing and the Quartus Prime Timing Analyzer.

Excel-based I/O timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis.

The Quartus Prime Timing Analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after you complete place-and-route.

## Programmable Output Buffer Delay

**Table 68: Programmable Output Buffer Delay for Cyclone V Devices**

This table lists the delay chain settings that control the rising and falling edge delays of the output buffer.

You can set the programmable output buffer delay in the Quartus Prime software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges, with the specific values stated here (in ps) for the **Output Buffer Delay** assignment.

Symbol	Parameter	Typical	Unit
D <sub>OUTBUF</sub>	Rising and/or falling edge delay	0 (default)	ps
		50	ps
		100	ps
		150	ps

Term	Definition
<p>Single-ended voltage referenced I/O standard</p>	<p>The JEDEC standard for the SSTL and HSTL I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state.</p> <p>The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing.</p> <p>Single-Ended Voltage Referenced I/O Standard</p>  <p>The diagram shows a trapezoidal waveform representing a signal transition. The top horizontal line is labeled <math>V_{CCIO}</math> and the bottom horizontal line is labeled <math>V_{SS}</math>. The waveform starts at a high level <math>V_{OH}</math>, falls through <math>V_{IH(AC)}</math> and <math>V_{IH(DC)}</math> to a low level <math>V_{OL}</math>, and then rises through <math>V_{IL(DC)}</math> and <math>V_{IL(AC)}</math> back to <math>V_{OH}</math>. A horizontal line labeled <math>V_{REF}</math> is positioned between <math>V_{IH(DC)}</math> and <math>V_{IL(DC)}</math>.</p>
<p><math>t_C</math></p>	<p>High-speed receiver/transmitter input and output clock period.</p>
<p>TCCS (channel-to-channel-skew)</p>	<p>The timing difference between the fastest and slowest output edges, including the <math>t_{CO}</math> variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the Timing Diagram figure under SW in this table).</p>
<p><math>t_{DUTY}</math></p>	<p>High-speed I/O block—Duty cycle on high-speed transmitter output clock.</p>

Term	Definition
$t_{\text{FALL}}$	Signal high-to-low transition time (80–20%)
$t_{\text{INCCJ}}$	Cycle-to-cycle jitter tolerance on the PLL clock input
$t_{\text{OUTPJ\_IO}}$	Period jitter on the GPIO driven by a PLL
$t_{\text{OUTPJ\_DC}}$	Period jitter on the dedicated clock output driven by a PLL
$t_{\text{RISE}}$	Signal low-to-high transition time (20–80%)
Timing Unit Interval (TUI)	The timing budget allowed for skew, propagation delays, and the data sampling window. (TUI = 1/ (Receiver Input Clock Frequency Multiplication Factor) = $t_c/w$ )
$V_{\text{CM(DC)}}$	DC common mode input voltage.
$V_{\text{ICM}}$	Input common mode voltage—The common mode of the differential signal at the receiver.
$V_{\text{ID}}$	Input differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission at the receiver.
$V_{\text{DIF(AC)}}$	AC differential input voltage—Minimum AC input differential voltage required for switching.
$V_{\text{DIF(DC)}}$	DC differential input voltage— Minimum DC input differential voltage required for switching.
$V_{\text{IH}}$	Voltage input high—The minimum positive voltage applied to the input which is accepted by the device as a logic high.
$V_{\text{IH(AC)}}$	High-level AC input voltage
$V_{\text{IH(DC)}}$	High-level DC input voltage
$V_{\text{IL}}$	Voltage input low—The maximum positive voltage applied to the input which is accepted by the device as a logic low.
$V_{\text{IL(AC)}}$	Low-level AC input voltage
$V_{\text{IL(DC)}}$	Low-level DC input voltage
$V_{\text{OCM}}$	Output common mode voltage—The common mode of the differential signal at the transmitter.
$V_{\text{OD}}$	Output differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission at the transmitter.
$V_{\text{SWING}}$	Differential input voltage
$V_{\text{X}}$	Input differential cross point voltage

Term	Definition
$V_{OX}$	Output differential cross point voltage
W	High-speed I/O block—Clock boost factor
