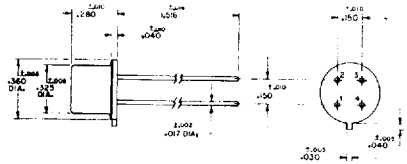
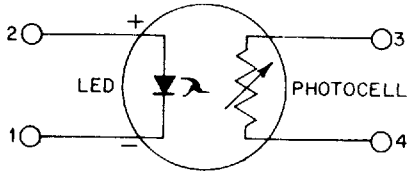
LED-Photoconductor Isolators





This new photomod series combines a photoconductive cell and an LED lamp in a hermetically sealed TO-5 package, for high reliability and long life. The moderate speed of response of the photoconductor eliminates much of the noise transmitted by silicon opto-isolators. This characteristic is especially useful in audio applications. All leads are isolated from the case.

RESPONSE TIME

The t_{RISE} and t_{DECAY} curve is the response time of the module when the lamp current is instantaneously varied from either zero to rated lamp current (t_{RISE}) or rated lamp current to zero (t_{DECAY}).

These curves are representative characteristics. For specific specifications, and application assistance, please contact the factory.

Notes:

(1) P.D. at 25°C case temperature. Derate linearly to 0 at 80°C. Allowable PHOTOMOD dissipation is determined by the photocell temperature which must not exceed 80°C for continuous operation. Lead soldering temp. 260°C, 5 sec. dwell max.

(2) After 24 hours on.

(3) Rise time measured after 24 hours on + 5 seconds off.

(4) Decay time measured from 24 hours on.
