

ADC1443D series

Dual channel 14-bit ADC; 125, 160 or 200 Msps;
JESD204B-compliant CGVxpress serial outputs

Rev. 1 — 28 September 2011

Objective data sheet

1. General description

The ADC1443D is a dual channel 14-bit Analog-to-Digital Converter (ADC) with JESD204B-compliant CGVxpress interface optimized for high dynamic performance and low power consumption at sample rates up to 200 Msps. Pipelined architecture and output error correction ensure the ADC1443D is accurate enough to guarantee zero missing codes over the entire operating range.

Supplied from a single 1.8 V source, the ADC1443D has serial outputs compliant with the JESD204B standard over a configurable number of lanes (1 or 2). Multiple Device Synchronization (MDS) allows sample-accurate synchronization of the data outputs of multiple ADC devices. MDS, which is a unique feature of the CGV and CGVxpress technology of NXP Semiconductors, guarantees a maximum skew of one clock period between as many as 16 output lanes from up to eight ADC1443D devices.

An integrated Serial Peripheral Interface (SPI) allows easy configuration of the ADC. The device also includes a programmable full-scale to allow a flexible input voltage range of 1 V (p-p) to 2 V (p-p).

With excellent dynamic performance from the baseband to input frequencies of up to 250 MHz or more, the ADC1443D is ideal for use in undersampled multi-carrier, multi-standard communication system applications. Using a pipelined architecture, an output error correction scheme ensures the ADC1443D is accurate enough to guarantee zero missing codes over the entire operating range.

The ADC1443D200 is available in an HLQFN56 package (8 mm × 8 mm outline). It is supported with customer demo boards. This device is also available in a 12-bit resolution variant with a choice of maximum sampling frequency (125, 160 or 200 Msps).

2. Features and benefits

- Dual channel 14-bit resolution ADC
- Sampling rate up to 200 Msps
- JESD204B Device Subclass 0, 1 and 2 compliant with harmonic clocking and deterministic latency support
- ADC Multiple Device Synchronization (MDS), CGVxpress feature
- Single 1.8 V supply
- SNR = 72.5 dBFS (typical);
 $f_s = 185$ Msps; $f_i = 190$ MHz
- SFDR = 86 dBc (typical); $f_s = 185$ Msps;
 $f_i = 190$ MHz
- IMD3 = 88 dBc (typical); $f_s = 185$ Msps;
 $f_{i1} = 188.5$ MHz; $f_{i2} = 191.5$ MHz
- Analog input bandwidth of 1 GHz (typical)
- Typical power dissipation = 1.0 W;
 $f_s = 200$ Msps

- Two JESD204B serial output lanes, up to 5 GspS typical
- Flexible input voltage range from 1 V (p-p) to 2 V (p-p) by 1 dB steps
- Clock input divider from 1 to 8 supports harmonic clocking
- Duty Cycle Stabilizer (DCS)
- Offset binary and two's complement output data
- Pin to pin compatible with ADC1413D series
- Power-down and sleep modes
- Industrial temperature range from -40 °C to +85 °C
- Serial Peripheral Interface (SPI) for configuration control and status monitoring
- HLQFN56 package; 8 mm × 8 mm

3. Applications

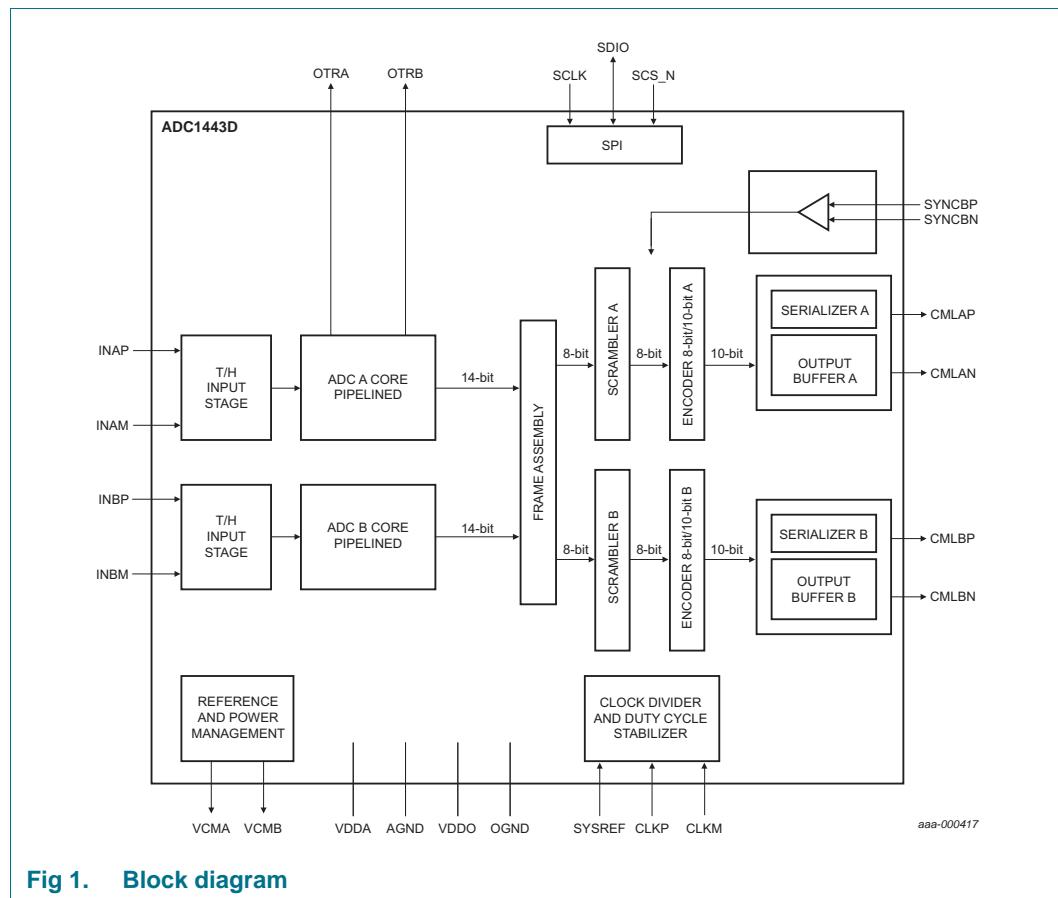

- Wireless infrastructure: LTE, TD-LTE, WiMAX, MC-GSM, CDMA, WCDMA, TD-SCDMA
- Software defined radio
- Medical non-invasive scanners
- Scientific particle detectors
- Microwave backhaul transceivers
- Aerospace and defense communications and radar systems
- Industrial signal analysis instruments
- General-purpose high-speed applications

4. Ordering information

Table 1. Ordering information

Type number	f_s (Msps)	Package			Version
		Name	Description	Version	
ADC1443D200HD	200	HLQFN56	plastic thermal enhanced low profile quad flat package; no leads; 56 terminals; resin based; body 8 × 8 × 1.35 mm	SOT935-2	
ADC1443D160HD	160	HLQFN56	plastic thermal enhanced low profile quad flat package; no leads; 56 terminals; resin based; body 8 × 8 × 1.35 mm	SOT935-2	
ADC1443D125HD	125	HLQFN56	plastic thermal enhanced low profile quad flat package; no leads; 56 terminals; resin based; body 8 × 8 × 1.35 mm	SOT935-2

11. Application information

11.1 Analog inputs

11.1.1 Input stage

The analog input of the ADC1443D supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with respect to the common-mode input voltage ($V_{I(cm)}$) on pins INP and INM.

The equivalent circuit of the sample and hold input stage, including ElectroStatic Discharge (ESD) protection and circuit and package parasitics, is shown in [Figure 24](#).

The sample phase occurs when the internal sampling clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the sampling clock signal becomes LOW, the device enters the hold phase and the voltage information is transmitted to the ADC core.

11.1.2 Common-mode input voltage ($V_{I(cm)}$)

Set the common-mode input voltage ($V_{I(cm)}$) on pins INP and INM externally to 0.9 V for optimal performance.

11.1.3 Pin VCM

When the input stage is AC-coupled, pin VCM can be used to set the common-mode reference for the analog inputs, for instance, via a transformer middle point. Connect a 0.1 μ F filter capacitor between pin VCM and ground to ensure a low-noise common-mode output voltage.

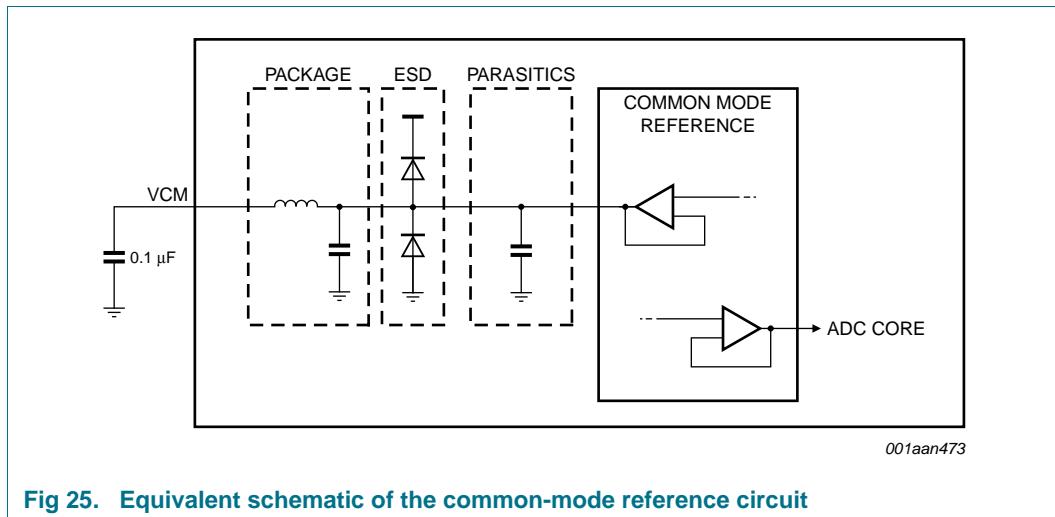

Fig 25. Equivalent schematic of the common-mode reference circuit

11.1.4 Programmable full-scale

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) by programming internal reference gain between 0 dB and –6 dB in 1 dB steps. The full-scale range can be set independently via bits INTREF[2:0] of the SPI local registers (see [Table 10](#) and [Table 24](#)).

Table 10. Reference gain control

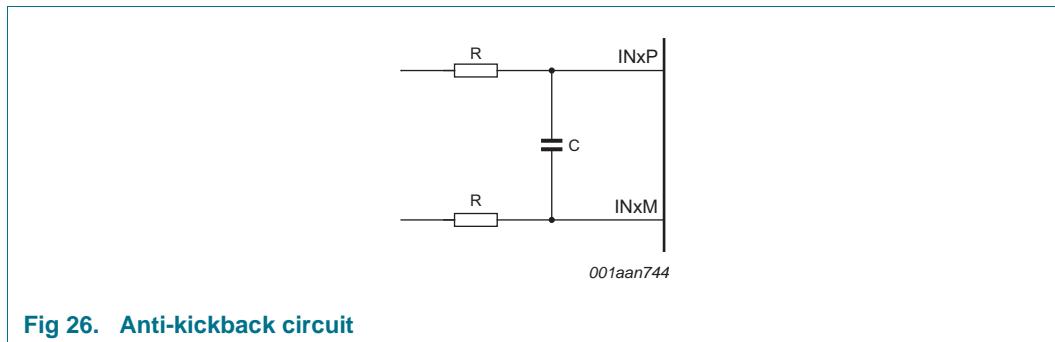

Default values are shown highlighted.

INTREF[2:0]	Level (dB)	Full-scale (V (p-p))
000	0	2
001	-1	1.78
010	-2	1.59
011	-3	1.42
100	-4	1.26
101	-5	1.12
110	-6	1
111	reserved	x

11.1.5 Anti-kickback circuitry

An anti-kickback circuitry (RC-filter in [Figure 26](#)) is required to counteract the effects of the charge injection generated by the sampling capacitance.

The RC-filter is also used to filter noise from the signal before it reaches the sampling stage. It is recommended that the capacitor has a value that maximizes noise attenuation without degrading the settling time excessively.

**Fig 26. Anti-kickback circuit**

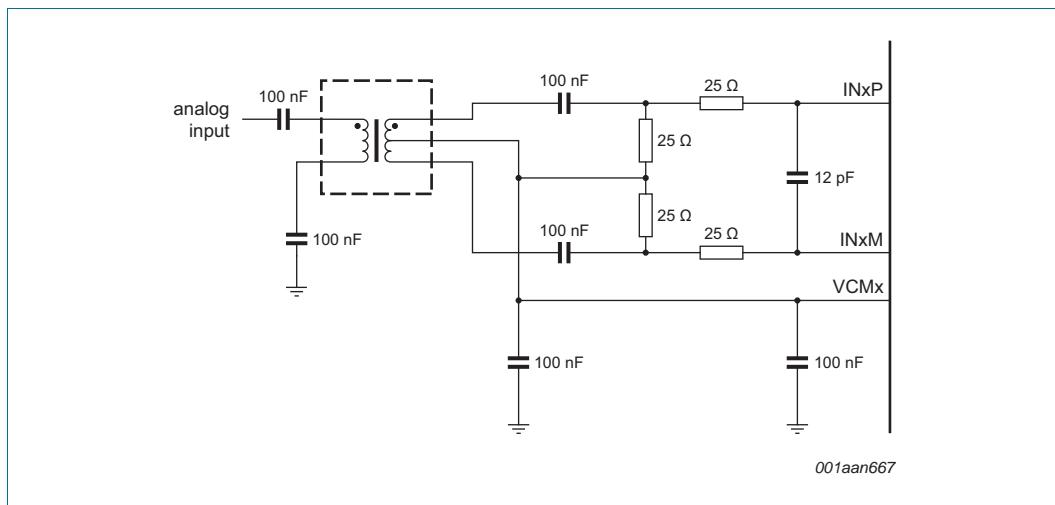

The input frequency determines the component values. Select values that do not affect the input bandwidth.

Table 11. RC coupling versus input frequency; typical values

Input frequency range (MHz)	R (Ω)	C (pF)
0 to 50	<tbd>	<tbd>
50 to 100	<tbd>	<tbd>
100 to 200	<tbd>	<tbd>
200 to 300	<tbd>	<tbd>

11.1.6 Transformer

The input frequency determines the configuration of the transformer circuit. The configuration shown in [Figure 27](#) is suitable for a baseband application.

**Fig 27. Single transformer configuration (baseband)**

The configuration shown in [Figure 28](#) is recommended for high-frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

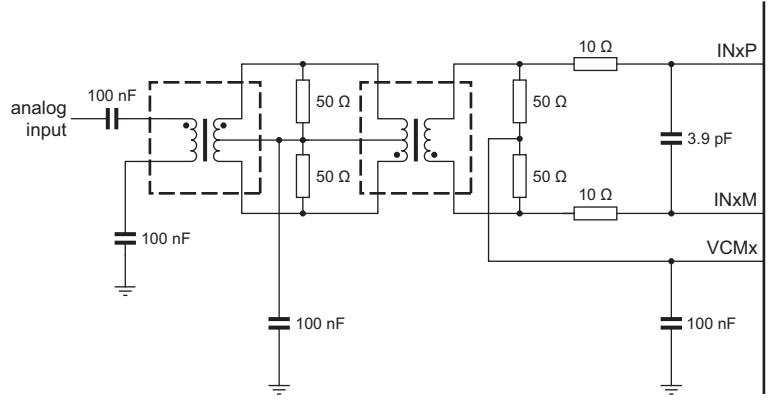

Fig 28. Dual transformer configuration (high IF)

11.2 Clock input

11.2.1 Drive modes

The ADC1443D series can be driven differentially (LVPECL, LVDS or SINE). It can also be driven by a single-ended LVCMS signal connected to either pin CLKP or pin CLKM (connect the complementary pin to ground using a capacitor). The LVPECL is recommended for an optimal performance.

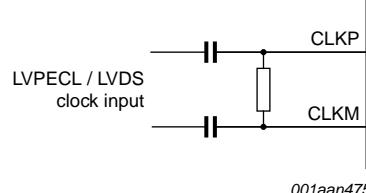

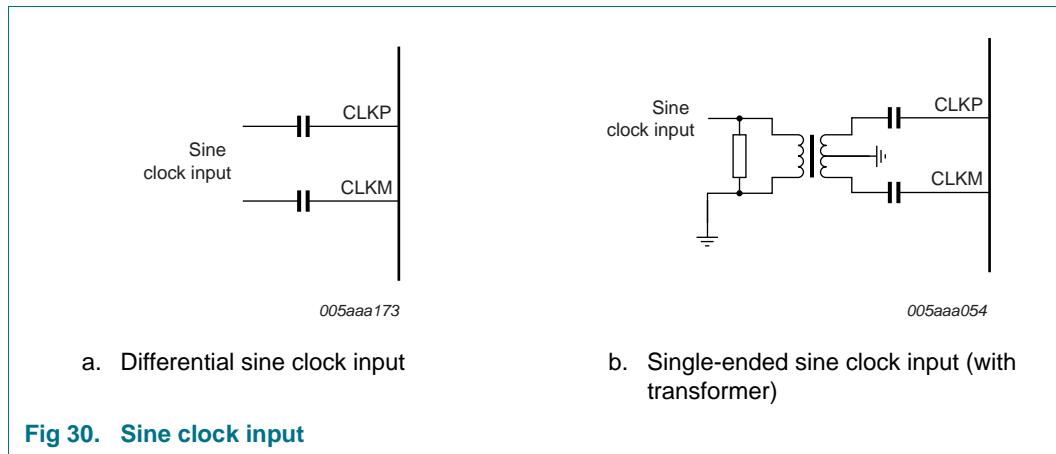

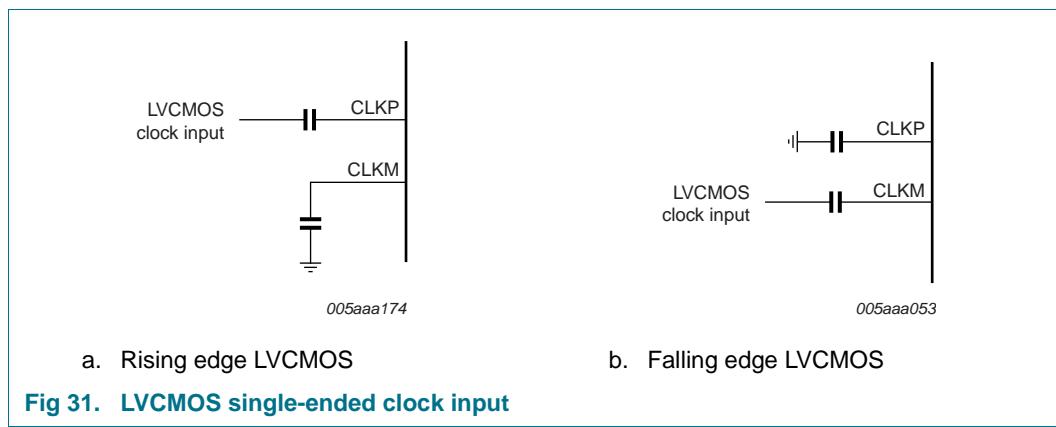

Fig 29. LVPECL/LVDS differential clock input

**Fig 30. Sine clock input****Fig 31. LVCMS single-ended clock input**

Single-ended or differential clock inputs can be selected via bit DIFF_SE of SPI. If single-ended is enabled, the input pin (pin CLKM or pin CLKP) is selected using control bit SE_SEL (see [Table 23](#)).

11.2.2 Equivalent input circuit

[Figure 32](#) shows the equivalent circuit of the input clock buffer. The input signal must be AC-coupled and the common-mode voltage of the differential input stage is set via internal 5 k Ω resistors.

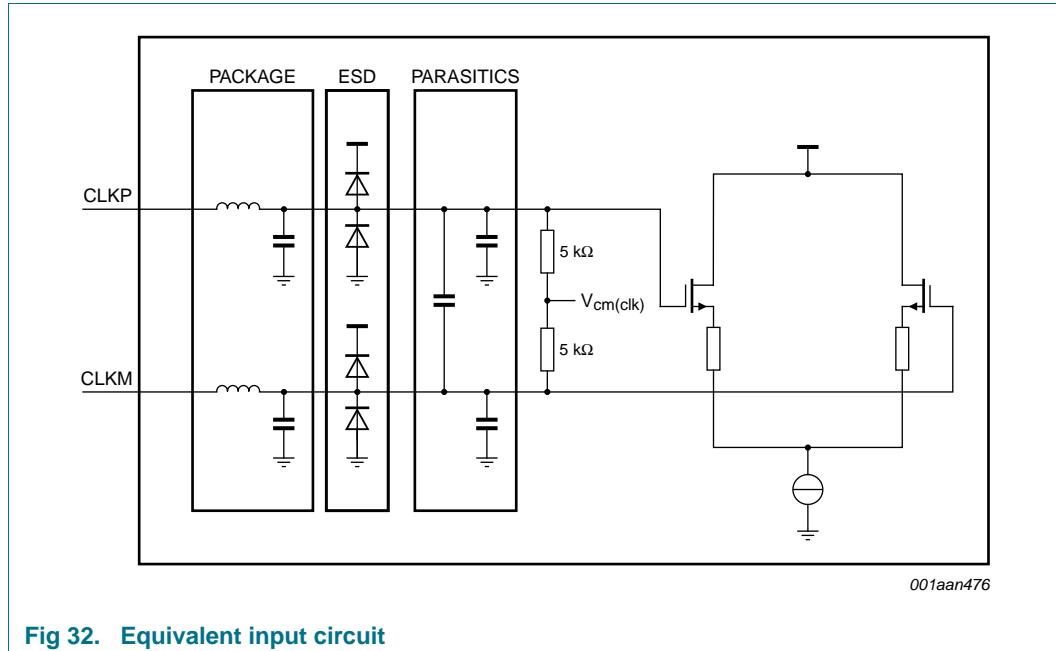

Fig 32. Equivalent input circuit

11.2.3 Clock input divider

The ADC1443D contains an input clock divider that divides the incoming clock (clock frequency f_{clk}) by a factor of 1 to 8. It outputs the sampling clock (sampling frequency f_s) (see bits CLK_DIV[1:0] in [Table 23](#)). This feature delivers a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

11.2.4 Multi-device synchronization (pins SYSREF, SYSREFN and SYSREFP)

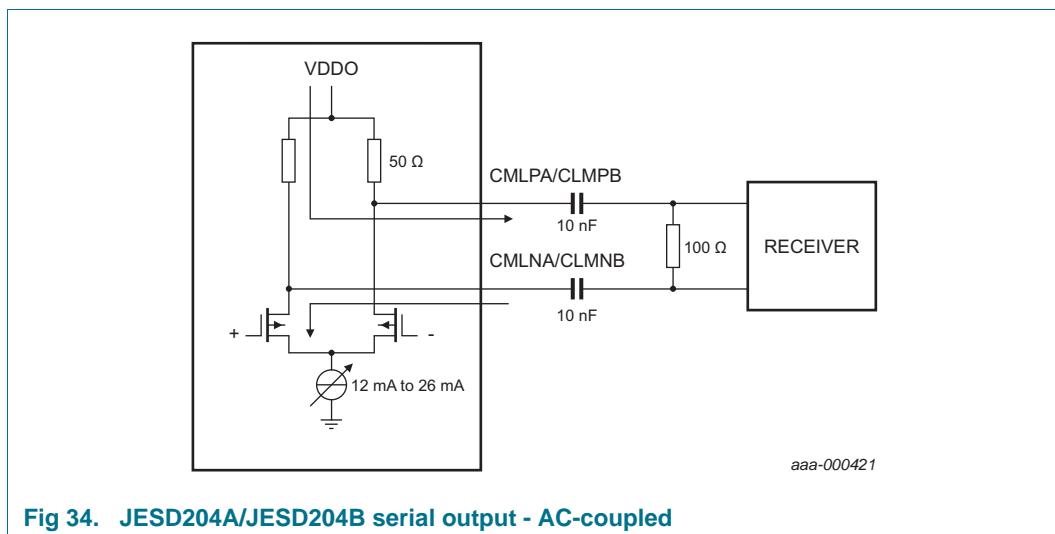

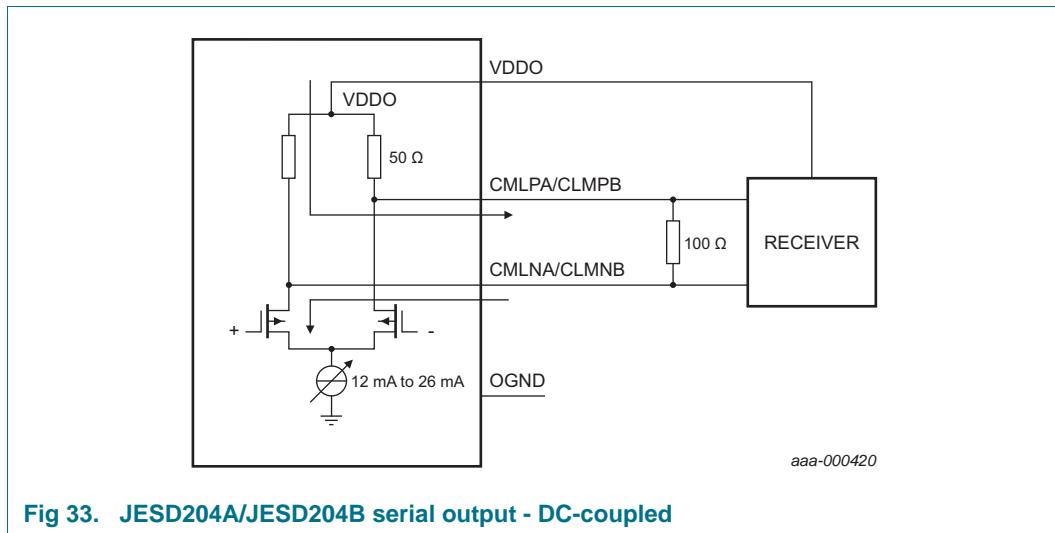

The multi-device synchronization can be controlled with a single-ended or a differential SYSREF signal.

A high level on SYSREF resets the clock divider phase registers. In a multi-device application and when the clock divider factor is higher than 1, the ADC1443D synchronization aligns all sampling clock edges (see [Table 8](#) and [Figure 4](#)).

11.3 Digital outputs

11.3.1 Digital output buffers

The JESD204A/JESD204B standard specifies that both the receiver and the transmitter must be provided by the same supply if they are connected in DC-coupling.

11.3.2 JESD204A/JESD204B serializer

11.3.2.1 Digital JESD204A/JESD204B formatter

The block placed after the ADC cores is used to implement all functionalities of the JESD204A/JESD204B standard. This ensures signal integrity and guarantees the clock and the data recovery at the receiver side.

The block is highly parameterized and can be configured in various ways depending on the sampling frequency and the number of lanes used.

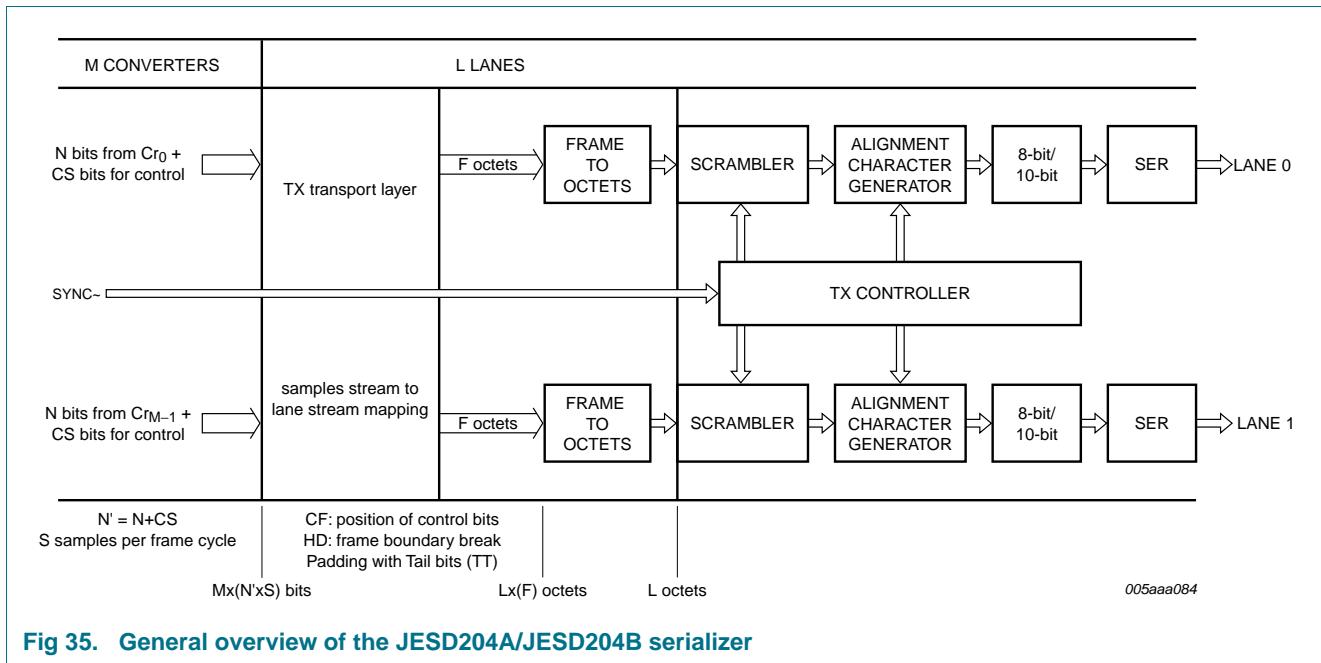

Fig 35. General overview of the JESD204A/JESD204B serializer

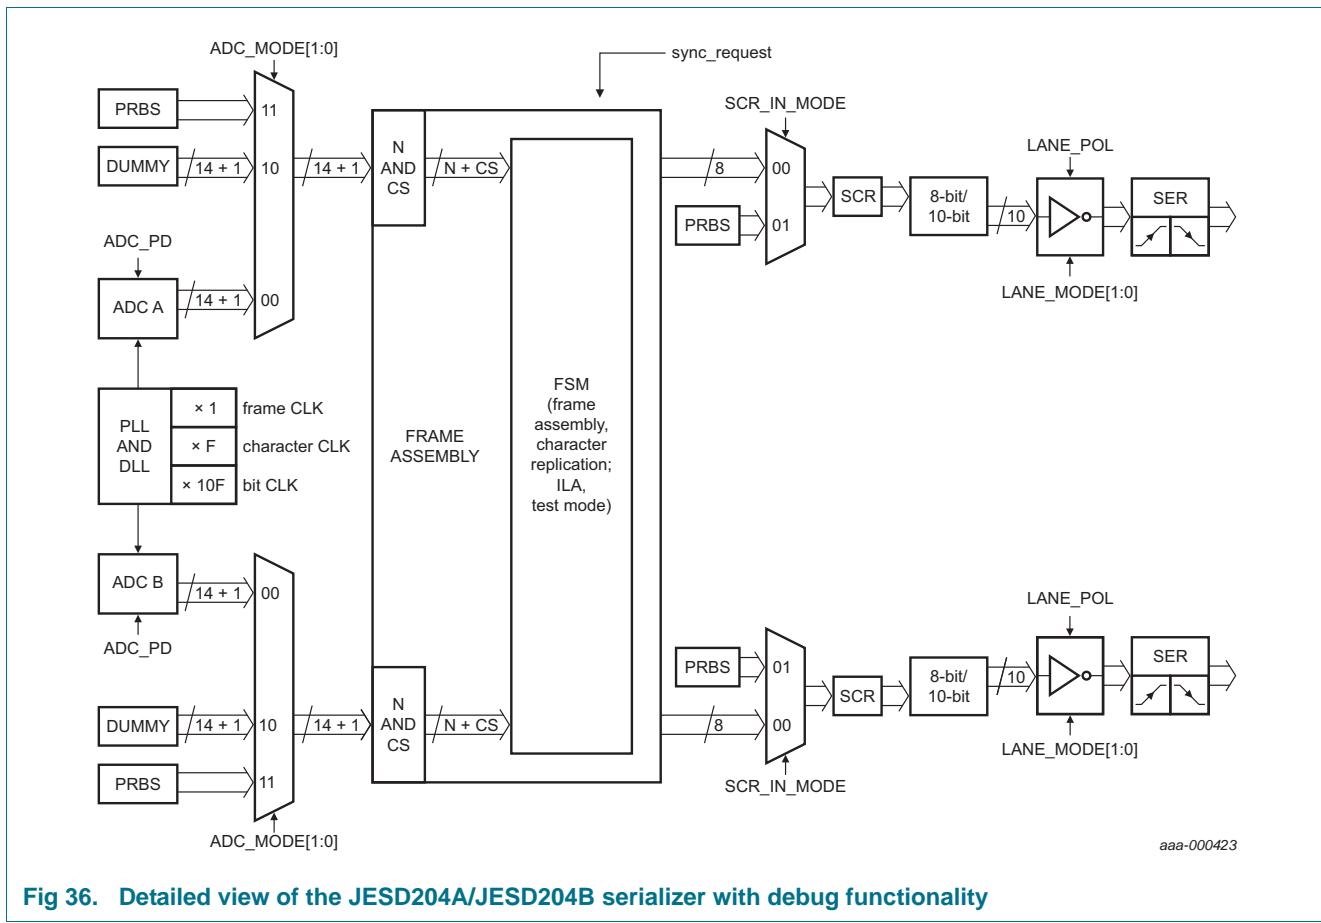

Fig 36. Detailed view of the JESD204A/JESD204B serializer with debug functionality

11.3.3 Out-of-Range (OTR)

An out-of-range signal is provided on pins OTRA and OTRAB.

The latency of OTR is 31 clock cycles. The OTR response can be speeded up by enabling fast OTR using SPI local registers (bit FAST_OTR in [Table 31](#)). In this mode, the latency of OTR is reduced to only <tbd> clock cycles. The fast OTR detection threshold (below full-scale) can be programmed using the SPI local registers (bits FAST_OTR_DET[2:0] in [Table 31](#)).

Table 12. Fast OTR register threshold

FAST_OTR_DET[2:0]	Detection level (dB)
000	-18.06
001	-14.54
010	-12.04
011	-8.52
100	-6.02
101	-4.08
110	-2.5
111	-1.16

11.3.4 Digital offset

By default, the ADC1443D delivers an output code that corresponds to the analog input. However, it is possible to add a digital offset to the output code using the SPI local registers (bits DIG_OFFSET[5:0] in see [Table 13](#) and [Table 27](#)). The digital offset adjustment is coded in two's complement.

Table 13. Digital offset adjustment

Default values are shown highlighted.

DIG_OFFSET[5:0]	Digital offset adjustment (LSB)
10 0000	-32
10 0001	-31
...	...
11 1111	-1
00 0000	0
00 0001	+1
...	...
01 1110	+30
01 1111	+31

11.3.5 Test patterns

The ADC1443D can be configured to transmit one of a number of predefined test patterns using the SPI local registers (bits TEST_PAT_SEL[2:0] in [Table 14](#) and [Table 28](#)). The selected test pattern is transmitted regardless of the analog input.

Table 14. Digital test pattern selection

Default values are shown highlighted.

TEST_PAT_SEL[2:0]	Digital test pattern
000	Off
001	Mid code
010	Min code
011	Max code
100	Toggle '1111..1111'/'0000..0000'
101	Custom test pattern
110	'1010..1010'
111	'0101..0101'

A custom test pattern can be defined using the SPI local registers (bits TEST_PAT_USER[13:6] in [Table 29](#) and bits TEST_PAT_USER[5:0] in [Table 30](#)).

11.3.6 Output data format selection

The ADC1443D output data format can be selected (offset binary, two's complement or gray code) using the SPI local registers (bits DATA_FORMAT[1:0] in [Table 26](#)).

11.3.7 Output codes versus input voltage

Table 15. Output codes

V _{INP} – V _{INM}	Offset binary	Two's complement	Gray code	OTR

> +1	11 1111 1111 1111	01 1111 1111 1111	10 0000 0000 0000	1

11.4 Configuration pins (CFG0, CFG1, CFG2, CFG3)

The configuration pins are only active as inputs at start-up. The values on those pins are read once to set up the device. Then the pins become outputs (OTRA and OTRB) and any change in the configuration is applied by SPI.

Table 16. JESD204A/JESD204B configuration table

[1] F: Octets per frame clock cycle

HD: High-density mode

K: Frame per multi-frame

M: Converters per device

L: Lane per converter device

CS: Number of control bits per conversion sample

CF: Control words per frame clock cycle and link

S: Number of samples transmitted per single converter per frame cycle

11.5 Serial Peripheral Interface (SPI)

11.5.1 Register description

The ADC1443D serial interface is a synchronous serial communications port, which allows easy interfacing with many commonly used microprocessors. It provides access to the registers controlling the operation of the chip.

The register bits are either global or local functions:

- A global function operates over the full IC behavior. A local function operates on one or several previously selected channels only. If a channel is selected, the next WRITE command in the local registers applies to the selected channel. The WRITE command has no impact on channels that are not selected. This makes it possible to apply different configurations on each channel by first selecting a specific channel and then all the related settings.
- Select only one channel during a READ operation of the local registers. If several channels are selected, the READ operation occurs on the channel A.

Programming all registers at the same time is required:

- The IC allows the storage of a set of settings for the addresses 06h to 23h, which enables the configuration of all registers simultaneously by setting bit TRANSFER to HIGH (see [Table 32](#)). This bit is autoclearing. This function can be disabled using SPI (bit TRANS_DIS in [Table 32](#)). The registers are then updated at each WRITE operation.
- The transfer function does not apply to a READ operation.

The SPI interface is configured as a 3-wire type: pin SDIO is the bidirectional pin, pin SCLK is the serial clock input and SCS_N is the chip select pin.

A LOW level on pin SCS_N initiates each READ/WRITE operation. A minimum of 3 bytes is transmitted (two instruction bytes and at least 1 DATA byte; see [Table 18](#)).

Table 17. Instruction bytes for the SPI

Bit:	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Description	R/W	W1	W0	A12	A11	A10	A9	A8
	A7	A6	A5	A4	A3	A2	A1	A0

- Bit R/W indicates whether it is a READ (when HIGH) or a WRITE (when LOW) operation.
- Bits W1 and W0 indicate the number of bytes to be transferred after both instruction bytes (see [Table 18](#)).

Table 18. Number of data bytes transferred

W1	W0	Number of bytes transferred
0	0	1 byte
0	1	2 bytes
1	0	3 bytes
1	1	4 or more bytes

- Bits A12 to A0 indicate the address of the register being accessed. If it concerns a multiple byte transfer, this address is the first register accessed. An address counter is increased to access subsequent addresses.

The steps for a data transfer are:

1. Communication starts with the first rising edge on pin SCLK after a falling edge on pin SCS_N.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data. Its length varies, but it is always a multiple of 8 bits. The MSB is always sent first (for instruction and data bytes).
4. A rising edge on pin SCS_N indicates the end on data transmission.

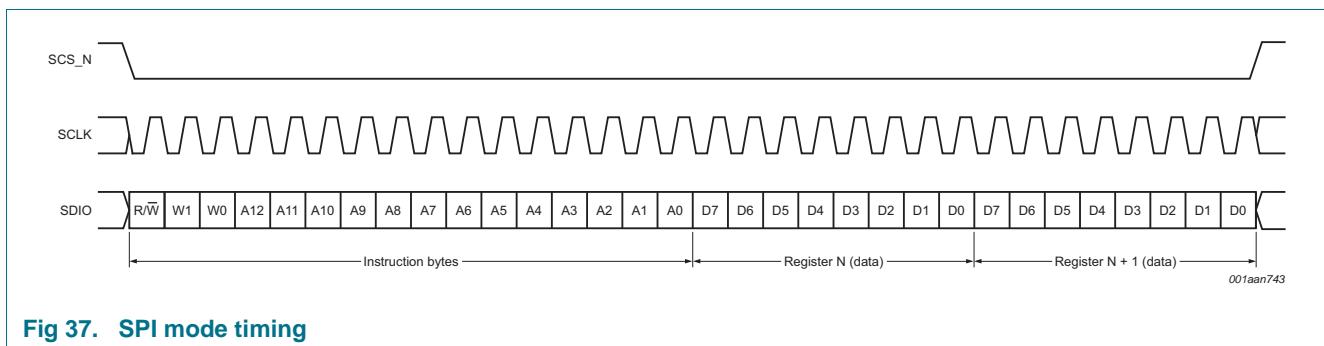

Fig 37. SPI mode timing

11.5.2 Register allocation map

[Table 19](#) shows an overview of all registers.

Table 19. Register allocation map

Addr. (hex)	Register name	R/W	Bit definition								Default

[1] The READ-ONLY and RESERVED registers.

[2] The registers influenced by the TRANSFER function.

[3] The LOCAL registers.

11.5.3 Detailed register description

The tables in this section contain detailed descriptions of the registers.

11.5.3.1 ADC control registers

Table 20. CHIP_RESET register (address 0000h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	SW_RST	R/W	-	resets global and local registers for any value “1” written at any bit (autoclear).

Table 21. CHIP_RESET register (address 0005h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SW_RST	R/W		resets global and local registers
			0	no reset
			1	performs a reset to the default values (autoclear)
6 to 0	-	-	-	not used

Table 22. OP_MODE register (address 0006h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	-	-	-	not used
1 to 0	OP_MODE[1:0] ^[1]	R/W		operating mode for the selected channel
			00	normal (power-up)
			01	power-down
			10	sleep
			11	not used

[1] Local register.

Table 23. CLK_CFG register (address 0007h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 5	-	-	-	not used
4	SE_SEL	R/W		single-ended clock input pin selection
			0	CLKP
			1	CLKM
3	DIFF_SE	R/W		differential/single-ended clock input selection
			0	fully differential
			1	single-ended

Table 23. CLK_CFG register (address 0007h) bit description ...continued
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
2 to 0	CLK_DIV[1:0]	R/W		clock divider selection
			000	divide by 1
			001	divide by 2
			010	divide by 3
			011	divide by 4
			100	divide by 5
			101	divide by 6
			110	divide by 7
			111	divide by 8

Table 24. INTERNAL_REF register (address 0008h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 3	-	-	-	not used
2 to 0	INTREF[2:0] ^[1]	R/W	-	see Table 10

[1] Local register

Table 25. CHANNEL_SEL register (address 0009h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	-	-	-	not used
1	ADC_B	R/W		channel B selection for next SPI operation in local registers
			0	not selected
			1	selected
0	ADC_A	R/W		channel A selection for next SPI operation in local registers
			0	not selected
			1	selected

Table 26. OUTPUT_CFG register (address 0011h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 3	-	-	-	not used
2	DATA_SWAP ^[1]	R/W		output data bits swapped
			0	no swapping
			1	MSBs swapped with LSBs

Table 26. OUTPUT_CFG register (address 0011h) bit description ...continued
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
1 to 0	DATA_FORMAT[1:0] ^[1]	R/W		output data format
			00	offset binary
			01	two's complement
			10	gray code
			11	offset binary

[1] Local register

Table 27. DIG_OFFSET register (address 0013h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	DIG_OFFSET[7:0] ^[1]	R/W	-	see Table 13
1 to 0	-	-	-	not used

[1] Local register

Table 28. TEST_CFG_1 register (address 0014h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 3	-	-	-	not used
2 to 0	TEST_PAT_SEL[2:0] ^[1]	R/W	-	see Table 14

[1] Local register

Table 29. TEST_CFG_2 register (address 0015h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	TEST_PAT_USER[13:6] ^[1]	R/W	-	custom digital test pattern (bits 13 to 6)

[1] Local register

Table 30. TEST_CFG_3 register (address 0016h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	TEST_PAT_USER[5:0] ^[1]	R/W	-	custom digital test pattern (bits 7 to 0)
1 to 0	-	-	-	not used

[1] Local register

Table 31. OTR_CFG register (address 0017h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 4	-	-	-	not used
3	FAST_OTR ^[1]	R/W		Selection OTR full-scale/ fast OTR
			0	OTR full-scale
			1	fast OTR
2 to 0	FAST_OTR_DET[3:0] ^[1]	R/W	-	

[1] Local register

Table 32. TRANS_CFG register (address 00FFh) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	TRANS_DIS	R/W		disable transfer function
			0	transfer function active
			1	registers updated on a WRITE command
6	TRANSFER	R/W		updates the registers with the written settings
			0	settings are stored
			1	registers updated (autoclear)
5 to 0	-	-	-	not used

11.5.3.2 JESD204A/JESD204B control registers

Table 33. IP_DIGITAL_ID register (address 0800h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 4	-	-	1010	not used
3 to 0	IP_DIG_ID[3:0]	R/W	****	

Table 34. IP_STATUS register (address 0801h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	RXSYNC_ERR_FLG	R/W	0	
6 to 4	RES_BONDING[2:0]	R/W	000	
3 to 2	-	-	0	not used
1	POR_TST	R/W	0	power-on reset
0	PLL_INLOCK	R/W	0	

Table 35. IP_RESET register (address 0802h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SW_RST	R/W	0	initiates a software reset of the JEDEC204A/JESD204B unit
6 to 4	-	-	000	not used
3	FSM_SW_RST	R/W	0	initiates a software reset of the internal state machine of JEDEC204A/JESD204B unit
2 to 0	-	-	000	not used

Table 36. IP_CFG_SETUP register (address 0803h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 4	-	-	0000	not used
3 to 0	CFG_SETUP[3:0]	R/W	****	

Table 37. IP_CTRL1 register (address 0805h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	ADC_DIRECT_SCSB	R/W	0	
6	TRISTATE_CFG_PATH	R/W	0 (1 > 0)	
5	SYNC_POL	R/W	0	synchronization polarity
4	SYNC_SE	R/W	0	
3	EN_RSSYNC_ERR	R/W	1	
2	REV_SCR_IN	R/W	0	
1	REV_ENC_IN	R/W	0	
0	REV_SER_IN	R/W	1	

Table 38. IP_CTRL2 register (address 0806h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	SCR_CLK_DIS	R/W	0	
6	PRECOMP_CLK_DIS	R/W	0	
5	MDSSYNC_CLK_DIS	R/W	0	
4	MDSDATA_CLK_DIS	R/W	0	
3 to 2	LANE_MAPPING[1:0]	R/W	**	
1	SWP_LANE_1_2	R/W	*	
0	SWP_ADC_0_1	R/W	*	

Table 39. IP_CTRL3 register (address 0807h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	MDS_EN	R/W	0	
6 to 4	SYNC_LATENCY[2:0]	R/W	000	
3 to 0	DATA_LATENCY[3:0]	R/W	0000	

Table 40. IP_SYSREF_TIME_OUT register (address 0808h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	SYSREF_TO[7:0]	R/W	0000 0000	

Table 41. IP_SCRAMBLER1 register (address 0809h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LSB_INIT[7:0]	R/W	0000 0000	

Table 42. IP_SCRAMBLER2 register (address 080Ah) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	MSB_INIT[7:0]	R/W	1111 1111	

Table 43. IP_PRBS_CTRL register (address 080Bh) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 3	-	-	00000	not used
2	PRBS_ON_SYNC	R/W	0	
1 to 0	PRBS_TYPE[1:0]	R/W	00	

Table 44. IP_PLL_CTRL1 register (address 080Ch) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 6	CK_DET_CUR[1:0]	R/W	00	
5 to 4	ICP_INT[1:0]	R/W	00	
3	PLL_REF_SEL	R/W	0	

Table 44. IP_PLL_CTRL1 register (address 080Ch) bit description ...continued
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
2	PLL_INLOCK_BYPASS	R/W	0	
1	PLL_TST_EN	R/W	*	
0	PLL_PD	R/W	*	

Table 45. IP_PLL_CTRL2 register (address 080Dh) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 3	PLL_CAL_CNTR[7:3]	R/W	10000	
2 to 0	PLL_P[2:0]	R/W	000	

Table 46. IP_DEBUG_OUT1 register (address 0816h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	-	-	000000	not used
1 to 0	PATTERN_OUT[9:8]	R/W	10	

Table 47. IP_DEBUG_OUT2 register (address 0817h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	PATTERN_OUT[7:0]	R/W	1010 1010	

Table 48. IP_DEBUG_IN1 register (address 0818h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	PATTERN_IN[15:8]	R/W	1010 1010	

Table 49. IP_DEBUG_IN2 register (address 0819h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	PATTERN_IN[7:0]	R/W	0000 0010	

Table 50. IP_SPARE_DEBUG register (address 081Ah) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 5	SPARE_DEBUG[7:5]	R/W	<tbd>	
4	SYNC_TAP_EN	R/W	<tbd>	
3 to 0	SYNC_TAP_SEL[3:0]	R/W	<tbd>	

Table 51. IP_OUTBUF01_CTRL register (address 0860h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 5	CTRL_SPARE[2:0]	R/W	000	
4 to 2	PREEMPH_CTRL[2:0]	R/W	000	
1	PREEMPH_PD	R/W	0	
0	FULL_PD	R/W	0	

Table 52. IP_OUTBUF02_CTRL register (address 0861h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 5	CTRL_SPARE[2:0]	R/W	000	
4 to 2	PREEMPH_CTRL[2:0]	R/W	000	
1	PREEMPH_PD	R/W	0	
0	FULL_PD	R/W	0	

Table 53. IP_OUTBUF03_CTRL register (address 0862h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 5	CTRL_SPARE[2:0]	R/W	000	
4 to 2	PREEMPH_CTRL[2:0]	R/W	000	
1	PREEMPH_PD	R/W	0	
0	FULL_PD	R/W	0	

Table 54. IP_OUTBUF04_CTRL register (address 0863h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 5	CTRL_SPARE[2:0]	R/W	000	
4 to 2	PREEMPH_CTRL[2:0]	R/W	000	
1	PREEMPH_PD	R/W	0	
0	FULL_PD	R/W	0	

Table 55. IP_OUTBUF01_SWING register (address 086Ah) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 5	SWING_SPARE[2:0]	R/W	000	
4 to 0	SWING[4:0]	R/W	001**	

Table 56. IP_OUTBUF02_SWING register (address 086Bh) bit description*Default settings are shown highlighted.*

3 to 1	-	-	000	not used
0	ADC_PD	R/W	0	

12. Package outline

HLQFN56R: plastic thermal enhanced low profile quad flat package; no leads;
56 terminals; resin based; body 8 x 8 x 1.35 mm

SOT935-2

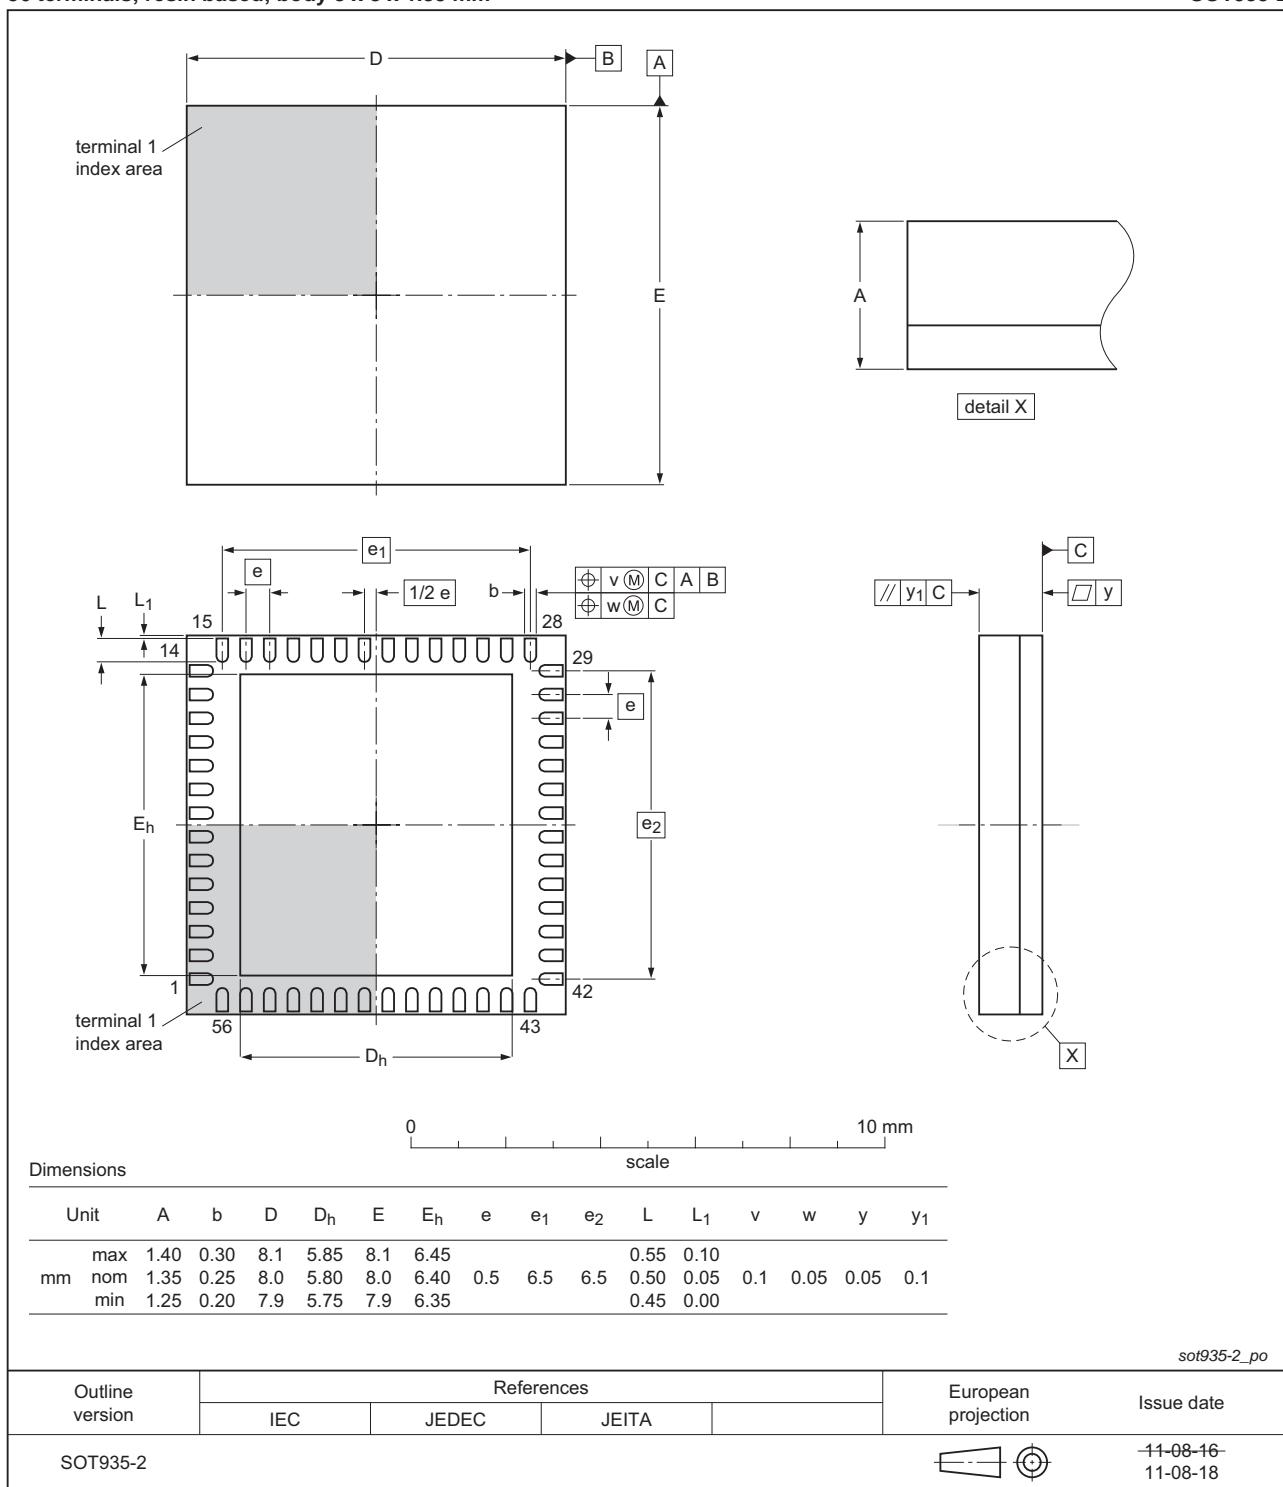

Fig 38. Package outline SOT935-2 (HLQFN56)

13. Abbreviations

Table 63. Abbreviations

Acronym	Description
ADC	Analog-to-Digital Converter
CDMA	Code Division Multiple Access
DAV	DAta Valid
ESD	ElectroStatic Discharge
FFT	Fast Fourier Transform
GSM	Global System for Mobile communications
IMD3	third order InterModulation product
LSB	Least Significant Bit
LTE	Long-Term Evolution
LVDS DDR	Low Voltage Differential Signaling Double Data Rate
LVPECL	Low-Voltage Positive Emitter-Coupled Logic
MIMO	Multiple Input Multiple Output
MSB	Most Significant Bit
OTR	OuT-of-Range
SFDR	Spurious-Free Dynamic Range
SPI	Serial Peripheral Interface
SNR	Signal-to-Noise Ratio
TD-SCDMA	Time Division-Synchronous Code Division Multiple Access
WCDMA	Wideband Code Division Multiple Access
WiMAX	Worldwide interoperability for Microwave Access

15. Legal information

15.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

15.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

malfuction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

15.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

17. Contents

1	General description	1	11.5.3	Detailed register description	36
2	Features and benefits	1	11.5.3.1	ADC control registers	36
3	Applications	2	11.5.3.2	JESD204A/JESD204B control registers	40
4	Ordering information	2	12	Package outline	45
5	Block diagram	3	13	Abbreviations	46
6	Pinning information	4	14	Revision history	47
6.1	Pinning	4	15	Legal information	48
6.2	Pin description	5	15.1	Data sheet status	48
7	Limiting values	7	15.2	Definitions	48
8	Thermal characteristics	7	15.3	Disclaimers	48
9	Static characteristics	7	15.4	Trademarks	49
10	Dynamic characteristics	10	16	Contact information	49
10.1	Dynamic characteristics	10	17	Contents	50
10.2	Timing	14			
10.2.1	Clock timing	14			
10.2.2	SYSREF timing	14			
10.2.3	SPI timing	15			
10.3	Typical dynamic performances	16			
11	Application information	20			
11.1	Analog inputs	20			
11.1.1	Input stage	20			
11.1.2	Common-mode input voltage ($V_{I(cm)}$)	20			
11.1.3	Pin VCM	20			
11.1.4	Programmable full-scale	21			
11.1.5	Anti-kickback circuitry	21			
11.1.6	Transformer	22			
11.2	Clock input	23			
11.2.1	Drive modes	23			
11.2.2	Equivalent input circuit	25			
11.2.3	Clock input divider	25			
11.2.4	Multi-device synchronization (pins SYSREF, SYSREFN and SYSREFP)	25			
11.3	Digital outputs	25			
11.3.1	Digital output buffers	25			
11.3.2	JESD204A/JESD204B serializer	26			
11.3.2.1	Digital JESD204A/JESD204B formatter	26			
11.3.3	OuT-of-Range (OTR)	28			
11.3.4	Digital offset	28			
11.3.5	Test patterns	29			
11.3.6	Output data format selection	29			
11.3.7	Output codes versus input voltage	29			
11.4	Configuration pins (CFG0, CFG1, CFG2, CFG3)	30			
11.5	Serial Peripheral Interface (SPI)	31			
11.5.1	Register description	31			
11.5.2	Register allocation map	33
