

July 1990

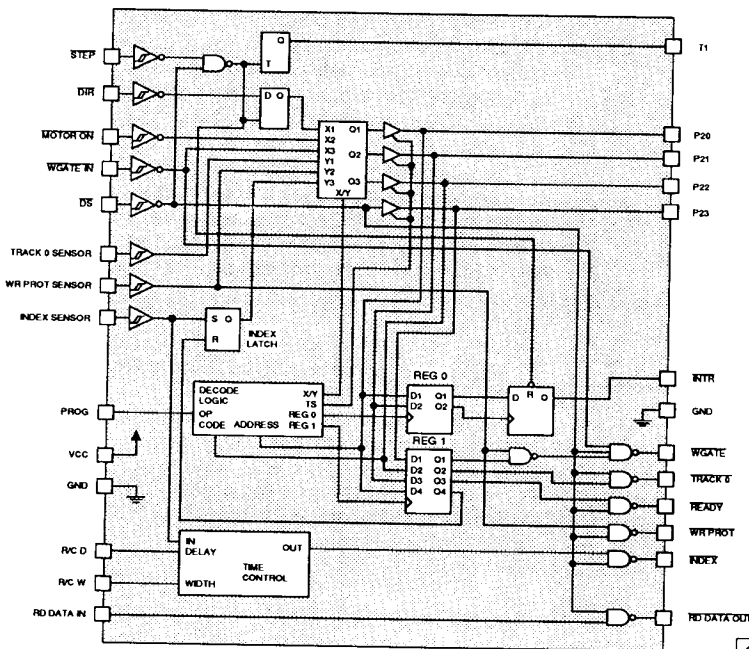

**DESCRIPTION**

The SSI 34B580 device is a bipolar integrated circuit that serves as an input/output port expander for an 8084 type microprocessor based floppy disk drive system. The device consolidates functions normally performed by a variety of LSTTL, SSI, AND MSI devices. The combination of an SSI 34P570 (read, write, and erase device), an 8048 type microprocessor, and the SSI 34B580 provides the majority of electronics required for a SA400 type floppy disk drive system, including host interface bus driver and receiver. In addition to its port expansion function, the SSI 34B580 processes system data and provides both pulse width and delay control (adjustable by external elements) for the INDEX SENSOR input. The device requires a single +5 V power supply and is available in a 28-pin package.

**FEATURES**

- Reduces package count in flexible disk drive systems
- Replaces bus interface and combinational logic devices between the SSI 34P570, on board microprocessor and mechanical interfaces
- Surface mount available for further real estate reduction
- Provides drive capability for mechanical and system interfaces

### FUNCTIONAL DESCRIPTION

#### PORTS

The SSI 34B580 has two 4-bit input ports, Port A and Port B. Port A receives data from the host interface bus for conveyance to the drive's read/write circuitry and to the microprocessor. Three sensors report the status of the drive to the 34B580 via Port B. Common to both ports is a drive select ( $\overline{DS}$ ) signal from the host interface bus. This allows the host to address separate disk drives. There is also a 4-bit bidirectional port on the SSI 34B580. This is port 2 and it can be used by the microprocessor to write to or read from the SSI 34B580.

#### READ MODE

Ports A and B can be read by a microprocessor via Port 2. This allows the microprocessor to obtain data from the host interface bus and the status sensors. The PROG signal from the microprocessor provides the timing for the operation. First an OP code and a port address must be placed on Port 2 (see Table 1), then latched in on the falling edge of PROG. When the OP code and addresses have been decoded, the desired input port is selected and output on Port 2. The operation is terminated by the rising edge PROG, which returns Port 2 to the input mode.

#### WRITE MODE

In the write mode the microprocessor passes system parameters to the SSI 34B580 for logic processing and outputting. Table 2 shows how each bit of Port 2 affects the SSI 34B580. A logic one on the zero bit of Port 2 will reset the index latch. P21, qualified by the  $\overline{DS}$  signal, sends a "this drive ready" signal from the microprocessor to the host interface bus. Similarly P22 is  $\overline{DS}$  qualified and sent to the host as a signal that the head is positioned over track 0. P23 is used in the logic that sends a R/W signal to the drive's read/write circuitry. The write mode occurs when the proper OP code and address is placed on Port 2 and latched in on the falling edge of PROG (see Table 2). The microprocessor writes in the data on PROG's rising edge.

#### INDEX PULSE

An optical sensor connected to the INDEX SENSOR pin detects the diskette's index marker. The state of the index sensor is latched into the SSI 34B580 and is available to be read by the microprocessor on P22. The latch may be reset by writing a one to P20 from the microprocessor. The pulse received from the sensor also drives the host interface signal  $\overline{INDEX}$ , the width and delay of which can be controlled by external R/C circuits. The time constant attached to the R/C D pin determines the delay from the INDEX SENSOR input to the  $\overline{INDEX}$  signal on the host interface bus. The equation for the delay is  $T_d = 0.59R_d \times C_d$  (seconds). The width of the  $\overline{INDEX}$  signal is determined by the circuit attached to the R/C W pin and the equation  $T_w = 0.59R_w \times C_w$  (seconds).

#### INTERRUPT

The  $\overline{INTR}$  signal is asserted every time a step command is issued to the drive on the host interface bus. Thus when  $\overline{INTR}$  is tied to the interrupt pin of 8048 type microprocessor, an interrupt service routine will be executed on each step command. This routine typically obtains information on the direction the heads should move and the status of the track 0 sensor to use for generating the stepper motor control signals. The interrupt signal is cleared (set high) by first placing the proper OP code and address on Port 2 (see Table 2). This is latched in on the falling edge of PROG, then on its rising edge logic ones on P20 and P21 will be latched in to set  $\overline{INTR}$  back to a high state. Note that an indeterminate operation will result from holding the INDEX SENSOR latch reset (holding P20 high).

#### T1 PIN

This signal changes state with the  $\overline{STEP}$  command of the host interface bus when the drive is selected. It drives the T1 pin on an 8048 type microprocessor which is an input to a counter. The 8048 can use this count and the DIR signal read from Port 2 of the SSI 34B580 to monitor the head position and issue a CB (current boost) command to the SSI 34P570 when a specific track is reached.

#### PIN DESCRIPTIONS

NAME	TYPE	DESCRIPTION
P20 - P23	I/O	4-bit bidirectional port, referred to as Port 2.
WGATE IN	I	This input command to write is asserted by the host interface bus.
MOTOR ON	I	This input command to turn on the spindle motor comes from the host interface bus.
DIR	I	Input from the host interface bus selecting the direction in which the stepper motor should move the head.
DS	I	Drive Select
INDEX SENSOR	I	Input from the photodiode that indicates the index marker in the diskette.
WR PROT SENSOR	I	Input from the photodiode that indicates if the diskette is write protected.
TRACK 0 SENSOR	I	Input from the photodiode that detects when the head is positioned over track 0.
STEP	I	Input from the host interface bus indicating that the head should be moved.
T1	O	This pin changes state when a STEP command is received from the host interface bus.
RD DATA IN and RD DATA OUT	I/O	Read data path
WGATE	O	Output to the disk drive's read/write circuitry.
INDEX	O	Output to the host interface bus indicating index sensor status.
TRACK 0	O	Output to the host interface bus indicating track 0 sensor status.
READY	O	Output to the host interface bus indicating track 0 sensor status.
WR PROT	O	Output to the host interface bus indicating write protect sensor status.
PROG	I	Input from the 8048 microprocessor for I/O control of the SSI 34B580.
INTR	O	Output to the interrupt pin of the 8048 microprocessor.
R/C D and R/C W		The external resistor and capacitor networks tied to these pins determine the delay and width of the output pulse to the INDEX pin.
Vcc		+5 V supply
GND		Ground

## ELECTRICAL SPECIFICATIONS

### ABSOLUTE MAXIMUM RATINGS (All voltages referred to GND)

Operation above absolute maximum ratings may permanently damage the device.

PARAMETER	RATING	UNIT
DC Supply	+ 7	VDC
Voltage Range (any pin to GND)	-0.4 to + 7	VDC
Power Dissipation	700	mW
Storage Temperature	-40 to + 125	°C
Lead Temperature (10 sec soldering)	260	°C

### ELECTRICAL CHARACTERISTICS

(Unless otherwise specified,  $4.75 \leq V_{CC} \leq 5.25$  VDC;  $0^{\circ}\text{C} < T_a < 70^{\circ}\text{C}$ )

PARAMETER	CONDITIONS	MIN	NOM	MAX	UNIT
<b>Totem pole outputs (P20 - P23, <math>\overline{\text{INTR}}</math>, T1)</b>					
Output High Voltage	$I_{OH} = -400$ A	2.5			V
Output Low Voltage	$I_{OL} = 2$ mA			0.5	V
<b>Open collector outputs (RD DATA OUT, INDEX, WGATE, TRACK0, READY, WR PROT)</b>					
Output High Current	$V_{OH} = 5.25$ V			250	$\mu\text{A}$
Output Low Voltage	$I_{OL} = 48$ mA			0.5 V	V
<b>Inputs (P20 - P23, PROG, RD DATA IN)</b>					
Input High Voltage		2.0			V
Input Low Voltage				0.8	V
Input Low Current	$V_{IL} = 0.5$ V			-0.8	mA
Input High Current	$V_{IH} = 2.4$ V			40	$\mu\text{A}$
Input Current	$V_{in} = 7.0$ V			0.1	mA
<b>Schmitt - Trigger Inputs (WGATE IN, MOTOR ON, DIR, DS, STEP)</b>					
Threshold Voltage	Positive Going, $V_{CC} = 5.0$ V	1.3		2.0	V
	Negative Going, $V_{CC} = 5.0$ V	0.6		1.1	V
Hysteresis	$V_{CC} = 5.0$ V	0.4			V
Input High Current	$V_{IH} = 2.4$ V			40	$\mu\text{A}$
Input Low Current	$V_{IL} = 0.5$ V			-0.4	mA
Input Current	$V_{IN} = 7.0$ V			0.1	mA
