

## SCAN182373A Transparent Latch with 25Ω Series Resistor Outputs

### General Description

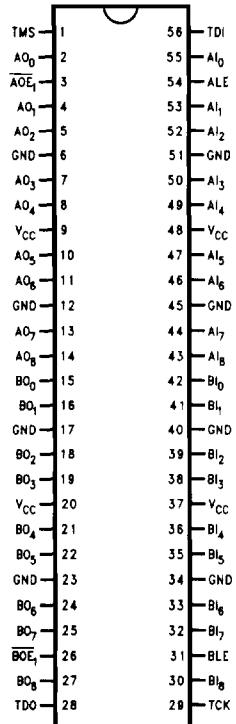

The SCAN182373A is a high performance BiCMOS transparent latch featuring separate data inputs organized into dual 9-bit bytes with byte-oriented latch enable and output enable control signals. This device is compliant with IEEE 1149.1 Standard Test Access Port and Boundary-Scan Architecture with the incorporation of the defined boundary-scan test logic and test access port consisting of Test Data Input (TDI), Test Data Out (TDO), Test Mode Select (TMS), and Test Clock (TCK).

### Features

- IEEE 1149.1 (JTAG) Compliant
- High performance BiCMOS technology
- 25Ω series resistor outputs eliminate need for external terminating resistors
- Buffered active-low latch enable
- TRI-STATE® outputs for bus-oriented applications
- 25 mil pitch SSOP (Shrink Small Outline Package)
- Includes CLAMP, IDCODE and HIGHZ instructions
- Additional instructions SAMPLE-IN, SAMPLE-OUT and EXTEST-OUT
- Power up TRI-STATE for hot insert
- Member of National's SCAN Products

**Ordering Code:** See Section 11

## Functional Description

The SCAN182373A consists of two sets of nine D-type latches with TRI-STATE standard outputs. When the Latch Enable (ALE or BLE) input is HIGH, data on the inputs (AI<sub>(0-8)</sub> or BI<sub>(0-8)</sub>) enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its input changes. When Latch Enable is LOW, the latches store the information that was present on the inputs a set-up time preceding the HIGH-to-LOW transition of the Latch Enable. The TRI-STATE standard outputs are controlled by the Output Enable (<sup>†</sup>AOE<sub>1</sub> or <sup>†</sup>BOE<sub>1</sub>) input. When Output Enable is LOW, the standard outputs are in the 2-state mode. When Output Enable is HIGH, the standard outputs are in the high impedance mode, but this does not interfere with entering new data into the latches.

## Description of BOUNDARY-SCAN Circuitry

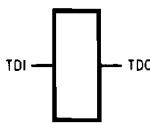

The scan cells used in the BOUNDARY-SCAN register are one of the following two types depending upon their location. Scan cell TYPE1 is intended to solely observe system data, while TYPE2 has the additional ability to control system data. (See IEEE Standard 1149.1 *Figure 10-11* for a further description of scan cell TYPE 1 and *Figure 10-12* for a further description of scan cell TYPE 2.)

Scan cell TYPE 1 is located on each system input pin while scan cell TYPE2 is located at each system output pin as well as at each of the two internal active-high output enable signals. AOE controls the activity of the A-outputs while BOE controls the activity of the B-outputs. Each will activate their respective outputs by loading a logic high.

The BYPASS register is a single bit shift register stage identical to scan cell TYPE1. It captures a fixed logic low.

The INSTRUCTION register is an 8-bit register which captures the default value of 10000001 (SAMPLE/PRELOAD) during the CAPTURE-IR instruction command. The benefit of capturing SAMPLE/PRELOAD as the default instruction during CAPTURE-IR is that the user is no longer required to shift in the 8-bit instruction for SAMPLE/PRELOAD. The sequence of: CAPTURE-IR → EXIT1-IR → UPDATE-IR will update the SAMPLE/PRELOAD instruction. For more information refer to the section on instruction definitions.

All Input Timing Delays involving TCK are measured from the rising edge of TCK.

Note 1: Timing pertains to BSR 38 and 41 only.

Note 2: This delay represents the timing relationship between the data input and TCK at the associated scan cells numbered 0-8, 9-17, 18-26 and 27-35.

Note 3: This delay represents the timing relationship between AOE/BOE and TCK for scan cells 36 and 39 only.

Note 4: Timing pertains to BSR 37 and 40 only.
