

Low Noise, 8th Order, Clock Sweepable Elliptic Lowpass Filter

FEATURES

- 8th Order Filter in a 14-Pin Package
- No External Components
- 100:1 Clock to Center Ratio
- $150\mu\text{V}_{\text{RMS}}$ Total Wideband Noise
- 0.03% THD or Better
- 50kHz Maximum Corner Frequency
- Operates from $\pm 2.37\text{V}$ to $\pm 8\text{V}$ Power Supplies
- Passband Ripple Guaranteed Over Full Military Temperature Range

APPLICATIONS

- Antialiasing Filters
- Telecom PCM Filters

DESCRIPTION

The LTC1064-1 is an 8th order, clock sweepable elliptic (Cauer) lowpass switched capacitor filter. The passband ripple is typically $\pm 0.15\text{dB}$, and the stopband attenuation at 1.5 times the cutoff frequency is 68dB or more.

An external TTL or CMOS clock programs the value of the filter's cutoff frequency. The clock to cutoff frequency ratio is 100:1.

No external components are needed for cutoff frequencies up to 20kHz. For cutoff frequencies over 20kHz two low value capacitors are required to maintain passband flatness. The LTC1064-1 features low wideband noise and low harmonic distortion even for input voltages up to 3V_{RMS} . In fact the LTC1064-1 overall performance competes with equivalent multi op amp RC active realizations.

The LTC1064-1 is available in a 14-pin DIP or 16-pin surface mounted SOL package.

The LTC1064-1 is pin compatible with the LTC1064-2.

TYPICAL APPLICATION

8th Order Clock Sweepable Lowpass Elliptic Antialiasing Filter

NOTE: THE POWER SUPPLIES SHOULD BE BYPASSED BY A $0.1\mu\text{F}$ CAPACITOR CLOSE TO THE PACKAGE.

FOR SERVO OFFSET NULLING APPLICATIONS, PIN 1 IS THE 2ND STAGE SUMMING JUNCTION.

*FOR CUTOFF FREQUENCY ABOVE 20kHz, USE COMPENSATION CAPACITORS (5pF – 56pF) BETWEEN PINS 13 AND 1 AND 6 AND 7.

Frequency Response

8TH ORDER CLOCK SWEEPABLE LOWPASS ELLIPTIC ANTIALIASING FILTER MAINTAINS, FOR $0.1\text{Hz} \leq f_{\text{CUTOFF}} \leq 10\text{kHz}$, a $\pm 0.15\text{dB}$ PASSBAND RIPPLE AND 72dB STOPBAND ATTENUATION AT $1.50 \times f_{\text{CUTOFF}}$.
 TOTAL WIDEBAND NOISE = $150\mu\text{V}_{\text{RMS}}$. THD = 0.03% FOR $V_{\text{IN}} = 1\text{V}_{\text{RMS}}$.

ABSOLUTE MAXIMUM RATINGS

Total Supply Voltage (V^+ to V^-)	16.5V
Power Dissipation	400mW
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec.)	300°C
Operating Temperature Range	
LTC1064-1M	-55°C to 125°C
LTC1064-1C	-40°C to 85°C

PIN DESCRIPTION

Power Supply Pins (4, 12)

The V^+ (pin 4) and V^- (pin 12) should be bypassed with a 0.1 μF capacitor to an adequate analog ground. Low noise, non-switching power supplies are recommended. To avoid latch up when the power supplies exhibit high turn-on transients, a 1N5817 schottky diode should be added from the V^+ and V^- pins to ground, Figure 1.

Clock Pin (11)

For $\pm 5V$ supplies the logic threshold level is 1.4V. For $\pm 8V$ and 0V to 5V supplies the logic threshold levels are

2.2V and 3V respectively. The logic threshold levels vary $\pm 100mV$ over the full military temperature range. The recommended duty cycle of the input clock is 50% although for clock frequencies below 500kHz the clock "on" time can be as low as 200ns. The maximum clock frequency for $\pm 5V$ supplies is 4MHz. For $\pm 7V$ supplies and above, the maximum clock frequency is 5MHz. Do not allow the clock levels to exceed the power supplies. For clock level shifting, see Figure 3.

Analog Ground Pins (3, 5)

For dual supply operation these pins should be connected to a ground plane. For single supply operation both pins

PIN DESCRIPTION

should be tied to one half supply, Figure 2. Also pins 8 and 10, although they are not internally connected should be tied to analog ground or system ground. This improves the clock feedthrough performance.

Connection Pins (7, 14)

A very short connection between pins 14 and 7 is recommended. This connection should be preferably done under the IC package. In a breadboard, use a one inch, or less, shielded coaxial cable; the shield should be grounded. In a PC board, use a one inch trace or less; surround the trace by a ground plane.

Compensation Pins (13 and 1, 6 and 7)

For filter cutoff frequencies higher than 20kHz, in order to minimize the passband ripple, compensation capacitors should be added between pins 6 and 7 (comp1) and pins 1 and 13 (comp2). For comp1 (comp2), add 1pF (1.5pF) mica

capacitor for each kHz increase in cutoff frequency above 20kHz. For more details refer to graphs 4, 5, and 6.

Input, Output Pins (2, 9)

The input pin 2 is connected to an 18k Ω resistor tied to the inverting input of an op amp. Pin 2 is protected against static discharge. The device's output, pin 9, is the output of an op amp which can typically source/sink 3/1mA. Although the internal op amps are unity gain stable, driving long coax cables is not recommended.

When testing the device for noise and distortion, the output, pin 9, should be buffered, Figure 4. **The op amp power supply wire (or trace) should be connected directly to the power source.**

NC Pins (8, 9)

The "no connection" pins preferably should be grounded.
