

# LVDT-to-Digital Converter

**FEATURES** 

Internal Signal Conditioning **Direct Conversion to Digits** Reference Frequency 400Hz or 1kHz to 10kHz High MTBF No External Trims Absolute Encoding

**APPLICATIONS** Industrial Measurement and Gauging **Numerical Control Avionic Control Systems** Valves and Actuators **Limit Sensing** 

# REFERENCE IPRIMARY EXCITATION PHASE AC RATIO BRIDGE DIFFERENTIAL SECONDARY VOLTAGE vco MONOSTABLE LATCHES NHIBI THREE-STATE OUTPUTS MONOSTABLE BUSY

FUNCTIONAL BLOCK DIAGRAM

#### GENERAL DESCRIPTION

The 2S50 series converters translate the outputs from LVDT and RVDT transducers into digits directly. No signal conditioning, trims, preamplifiers, demodulators or filters are required. The 2S50 series can also be used as general purpose ratiometric A-to-D converters; very compatible with load cells, strain gauge bridges, some pressure transducers and interferometers.

The 2S50 linearly converts ac signals into an 11-bit parallel digital word. The digital output is an offset binary word which is the ratio of the signal and reference inputs. When used with LVDT and RVDT transducers, the digital output represents the linear or rotary displacements of the transducer. The converter is a continuous tracking type using a type 2 servo loop.

#### PRINCIPLE OF OPERATION

The 2S50 is a tracking converter. This means that the output automatically follows the input without the necessity of a convert command.

A conversion is initiated by a change of input signal equivalent to ILSB of the output.

Each LSB increment of the output is indicated by a "Busy" pulse.

With an LVDT connected to give a null at center position, the output will track the input from digital "1 + all zeroes" to digital "all ones" for plus full scale, and digital "1 + all zeroes" to digital "all zeroes" for negative full scale.

The 2S50 operates only on the ratio of the two inputs for the conversion process. As such the whole system, consisting of excitation oscillator, LVDT and converter, is insensitive to change in excitation voltage, amplitude, frequency and waveshape.

Since a phase sensitive demodulator is included with the conversion loop of the 2S50, the system has a high rejection to signals that are not phase and frequency coherent with the excitation voltage. This feature, combined with ratiometric conversion gives a very high standard of integrity to digitized LVDT and RVDT systems.

#### PIN FUNCTION DESCRIPTION

| $-\mathbf{v_s}$   | Main negative power supply - 15V dc.                        |
|-------------------|---|
| $+V_{S}$          | Main positive power supply + 15V dc.                        |
| + 5V              | Logic supply.   |
| GND               | Power supply ground. Digital ground. Reference voltage low. |
| Bit 1-11          | Parallel output data bits.                                  |
| Ref Hi<br>Diff Hi | Analog reference input (Hi). Analog difference input (Hi).  |
| Ref Lo            | Analog reference input (Lo).                                |
| Diff Lo )         | Analog difference input (Lo).                               |

INHIRIT Inhibit logic input. Taking this pin "Lo"

> inhibits data transfer from counter to output latches. The conversion loop continues to

track.

BUSY

Converter BUSY. A "Hi" output indicates that the output latches are being updated. Data should not be transferred from the converter

while BUSY is "Hi".

**ENABLE** The output data bits are set to a low impedance

state by application of a logic "Lo".

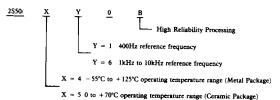

CASE This should normally be grounded. Case can be

taken to any voltage with a low impedance

up to  $\pm 20$ V.

N/C Pins designated N/C not connected internally.

## NOTES

 $^{1}$ Accuracy applies over  $\pm 20\%$  signal voltage,  $\pm 20\%$  excitation frequency and full temperature range,

and for not greater than 3° phase error between reference and difference inputs.

Specifications subject to change without notice.
