SN54HC7022, SN74HC7022 OCTAL COUNTERS/DIVIDERS WITH POWER-UP CLEAR

D2804, MARCH 1984-REVISED SEPTEMBER 1987

- Carry-Out Output for Cascading
- Divide-by-N Counting
- DC Clock Input Circuit Allows Slow Rise Times
- Power-Up Reset
- Pin-Out Compatible with 'HC4022
- Package Options Include Plastic "Small Outline" Packages, Ceramic Chip Carriers, and Standard Plastic and Ceramic 300-mil
- Dependable Texas Instruments Quality and Reliability

description

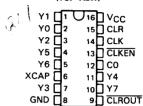

The 'HC7022 is a four-stage divide-by-8 Johnson counter with eight decoder outputs and a carry-out bit. High-speed operation and spike-free outputs are obtained by use of the Johnson octal counter configuration.

The eight decoder outputs are normally low and go high only at their respective octal time periods. A high signal on CLR asynchronously clears the octal counter and sets the carry output and Y0 high. With CLKEN low, the count is advanced on a low-to-high transition at CLK. Alternatively, if CLK is high, the count is advanced on a high-to-low transition at CLKEN. Each decoded output remains high for one full clock cycle. The carry output C0 is high while Y0, Y1, Y2, or Y3 is high, then is low while Y4, Y5, Y6, or Y7 is high.

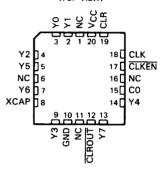

This part is similar to the 'HC4022; the main difference is that it includes a power-up-clear circuit to reset the counter during the power-up of the device. The active-low open-drain clear output, CLROUT, can be used to clear or rest external circuitry. The pulse duration of the power-up reset circuit can be controlled with an external capacitor Cext connected to pin XCAP. If XCAP is connected to VCC, the power-up reset function is bypassed.

The SN54HC7022 is characterized for operation over the full military temperature range of -55°C to 125°C. The SN74HC7022 is characterized for operation from -40°C to 85°C.

SN54HC7022 .V. FK PACKAGE

NC-No internal connection

logic symbol†

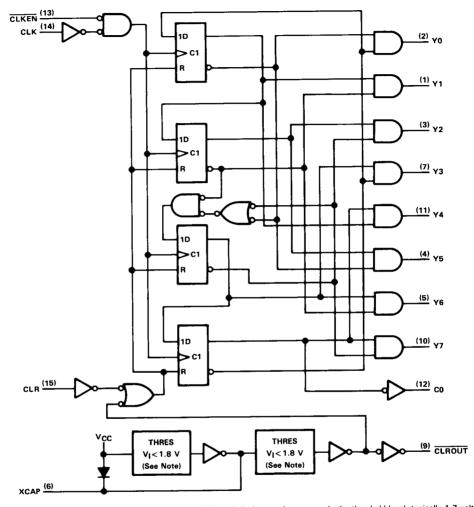

[†]This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.

Pin numbers shown are for DW, J, and N packages.

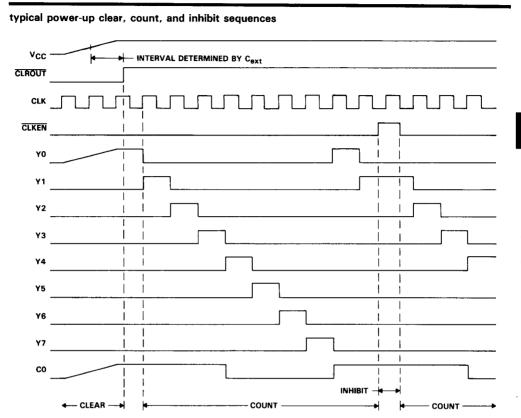

logic diagram (positive logic)

Note: The output of each threshold detector is logically high until the input voltage exceeds the threshold level, typically 1.7 volts. Pin numbers shown are for DW, J, and N packages.

absolute maximum ratings over operating free-air temperature range †

Supply voltage, VCC0.5 V to 7 V
Input clamp current, I _{IK} (V _I < 0 or V _I > V _{CC})
Output clamp current, IOK (VO < 0 or VO > VCC)
Continuous output current, IQ (VO = 0 to VCC)
Continuous current through VCC or GND pins
Lead temperature 1,6 mm (1/16 in) from case for 60 s: FK or J package
Lead temperature 1,6 mm (1/16 in) from case for 10 s: DW or N package
Lead temperature 1,6 min (1/16 iii) from case 16/16 s. BW 6/16 paskage
Storage temperature range65 °C to 150 °C

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
