induSENSOR Linear inductive displacement sensors

LVDT series: Displacement sensors with external electronics

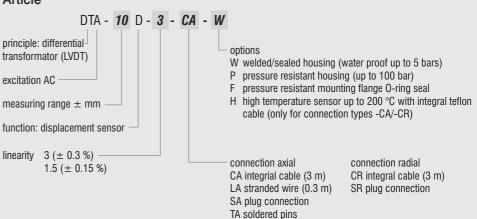

Measurement ranges ±1 ... ±25 mm Extremely accurate also under difficult ambient conditions Long-term stability

Wear-free

Easy installation

Displacement sensors have a plunger which moves freely in the sensor housing. The plunger is joined to the object by a thread to transfer the movement of the measurement object. The measurement process in the sensor takes place without contact and is therefore wear-free. The displacement sensors are mainly used to measure and monitor movements, displacements, positions, strokes, deflections, dislocations, etc. in vehicles, machines and systems. The high sensor resolution is limited only by the noise in the sensor electronics. A further advantage of the symmetrically constructed sensors in the LVDT series is the zeropoint stability of the systems. The sensors are supplied with an excitation frequency of 1 to 5 kHz depending on the measurement range and an excitation amplitude of 2.5 to 5 Vrms. Matched sensor electronics are available in this respect. With appropriate setting possibilities for the excitation frequency and amplitude, the sensors can also be operated with alternative electronics.

monitoring the yarn thickness in textile machines. The miniaturized sensor and the board-mounted electronics can be costeffectively integrated into the available installation spaces and machine controllers. The system is characterized by high stability and repeatability.

The KRS719 sensor system is used for

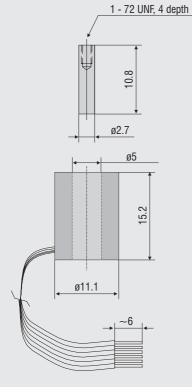

The plunger can be introduced into the sensor from both ends.

Miniature sensor with radial cable output DTA-0,8D-2,5-LR

OEM sensor for large-scale applications Miniaturized design Radial cable output High accuracy

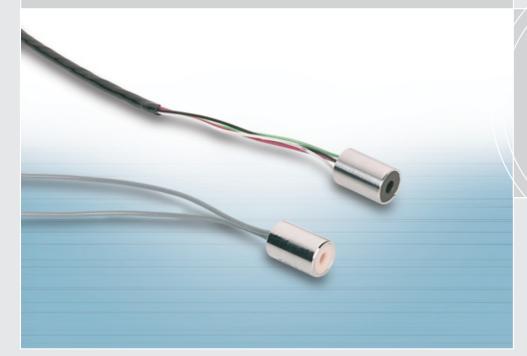

The miniature sensor DTA-0,8D-2,5-LR was designed and developed for use where the installation space is restricted. In addition, due to the low core weight the dynamic response of the measurement object is retained and mechanical loads are minimized.

Due to the radial cable output, the installation space behind the sensor can be fully exploited. With a linearity of <0.25% this sensor model is also suitable for measurements with high accuracy requirements.

Miniature sensor with axial cable output DTA-1D-CA-U

OEM sensor for large-scale applications Miniaturized design Axial cable output

As the sensor DTA-0,8D-2,5-LR, the miniature sensor DTA-1D-CA-U was designed and developed especially for used in restricted installation space. Due to the low core weight, the measurement object dynamic response is retained and mechanical loads are minimized.

With this configuration the cable output is brought out axially so that the installation space surrounding the sensor can be fully exploited. This means, for example, that the sensor can be installed sunk into a hole.

Sensor for valve stroke measurements DTA-6D-20 (07)

Sensor for large-scale use for valve stroke measurements Well-proven OEM sensor Plastic housing

Due to the use of a plastic housing, the sensor DTA-6D-20(07) can be offered at a very reasonable price. The configuration of the sensor facilitates, depending on the plunger used, a useful measurement range of $\pm 2 \text{ mm}$ to $\pm 8 \text{ mm}$.

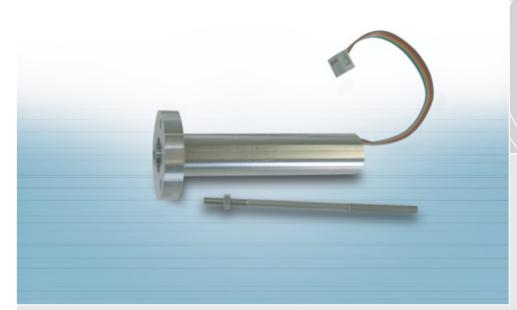

In a typical application this sensor is used for the measurement of the piston position in hydraulic valves. To facilitate exact dosage and therefore also a controlled movement, displacement sensors of the product line DTA-6D-20 are integrated into these valves. The sensors acquire the position of the control plunger, controlling the volume flow. To do this, an accurate, non-contacting and primarily dynamic position acquisition is required. The sensor is mounted here outside of the pressurized area on a pressure pipe.

Half-bridge sensor with plastic housing DRA-25D-20-SR-02

Plastic housing Integrated Rast 2.5 plug Extrusion coated core

The displacement sensor DRA-25D-20-SR(02) has been derived from the wellproven large-scale applications system for loading and unbalance detection in washing machines. The sensor is particularly well suited for applications in which displacements of up to 50 mm must be acquired economically and reliably. The sensor is integrated and protected within the machine or equipment. The integral 3pole plug corresponds to the standardized Rast 2.5 dimensions.

MSC710 sensor controller for LVDT series

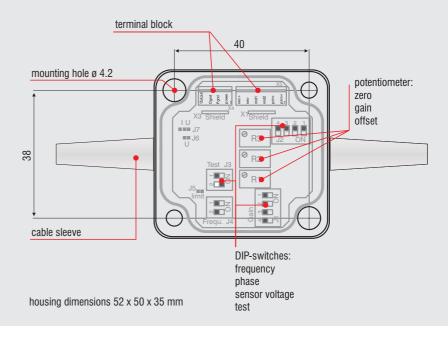

Excellent linearity and resolution Zero and gain adjustable coarse/fine Excitation frequency 1 ... 10 kHz (selectable)

Compact and robust EMI-proofed housing

The MSC710 is a single-channel miniature sensor controller for the operation of inductive displacement sensors based on the LVDT principle (Linear Variable Differential Transformer). Its compact, but rugged design, makes it suitable for both industrial and laboratory applications. Easily accessible and simple to operate, by using DIP-switches. The electronic unit can be matched to a wide range of sensors.
