

Two-Wire Hall-Effect Latch

FEATURES AND BENEFITS

- ASIL A functional safety
 - Developed in accordance with ISO 26262:2011 (pending assessment)
 - Internal diagnostics and a defined Safe State
 - A²-SIL™ documentation available
- Multiple product options
 - Magnetic polarity, switchpoints, and hysteresis
 - Temperature coefficient (supports SmCo, NdFeB, and ferrite magnets)
 - Output polarity and current levels
- Reduces module bill of materials (BOM) and assembly cost
 - Integrated overvoltage clamp (40 V load dump) and reverse-battery diode
 - Integrated series resistor and bypass capacitor (UC package)
 - Enables PCB-less sensor modules
- Automotive-grade ruggedness and fault tolerance
 - Extended AEC-Q100 Grade 0 qualification
 - Operation at -40°C to 175°C junction temperature
 - 3 to 24 V operating voltage range
 - High EMC/ESD immunity
 - Overtemperature indication

PACKAGES

3-pin ultramini SIP (UA)

3-pin SIP (UC)

Not to scale

DESCRIPTION

APS12400 devices are two-wire planar Hall-effect sensor integrated circuits (ICs) developed in accordance with ISO 26262:2011 (pending assessment). They include internal diagnostics and support a functional safety level of ASIL A. The enhanced two-wire current-mode interface provides interconnect open/short diagnostics and adds a Safe State to communicate diagnostic information while maintaining compatibility with legacy two-wire systems. Two-wire sensors are well-suited to safety applications, especially those involving long wire harnesses.

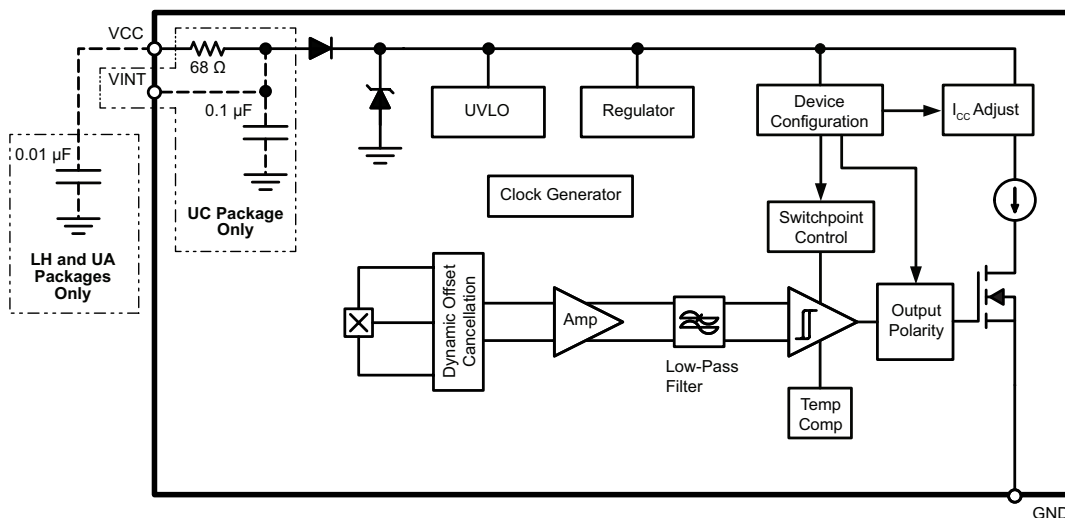

The APS12400 is a factory-calibrated latch (bipolar switch) available in several product options including magnetic switchpoints, temperature coefficient, and output polarity. The response can be matched to SmCo, NdFeB, or low-cost ferrite magnets. There is a choice of two output current levels and either output polarity.

APS12400 sensors are engineered to operate in the harshest environments with minimal external components. They are qualified beyond the requirements of AEC-Q100 Grade 0 and will survive extended operation at 175°C junction

Continued on the next page...

TYPICAL APPLICATIONS

- Automotive and Industrial safety systems
- Sun roof/convertible top/tailgate/liftgate actuation
- Clutch-by-wire
- Electric Power Steering (EPS)
- Transmissions actuators
- Wiper motors

Functional Block Diagram

DESCRIPTION (continued)

temperature. These monolithic ICs include on-chip reverse-battery protection, overvoltage protection (40 V load dump), ESD protection, overtemperature detection, and an internal voltage regulator for operation directly from an automotive battery bus. These integrated features reduce the end-product bill of materials (BOM) and assembly cost.

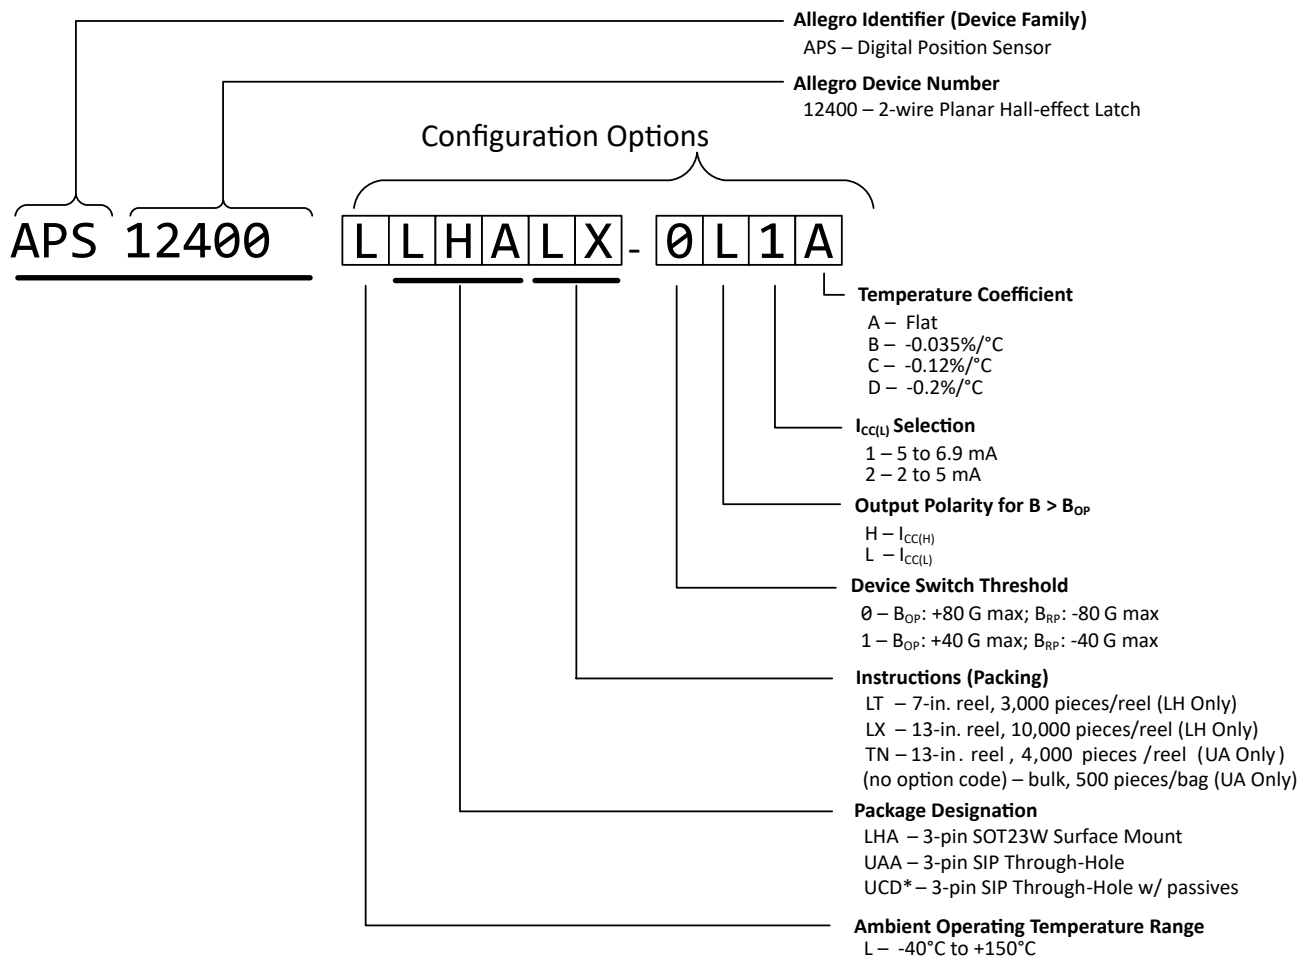

The available SIP package with integrated discrete components (UC) enables PCB-less applications by incorporating all of the EMC

protection components into the IC package. Other package options include industry-standard surface-mount SOT (LH) and through-hole SIP (UA) packages. All three packages are RoHS-compliant and lead (Pb) free with 100% matte-tin-plated leadframes.

For situations where a functionally equivalent but factory-programmed two-wire latch or end-of-line programmable device is preferred, refer to the APS12400 and APS11900 device families, respectively.

UA Package, 3-Pin SIP Pinout

Terminal List Table (UC Package)

Number	Package Name	Function
	UC	
1	VCC	Supply voltage
2	VINT	This pin reflects the internal voltage, V_{INT} , after the internal series resistor. This pin should be kept floating.
3	GND	Ground terminal

UC Package, 3-Pin SIP Pinout

ELECTRICAL CHARACTERISTICS: Valid over full operating voltage and ambient temperature ranges for $T_J < T_{J(max)}$ and $C_{BYP} = 0.01 \mu F$, unless otherwise specified

Characteristics	Symbol	Test Conditions	Min.	Typ. [3]	Max.	Unit	
SUPPLY AND STARTUP							
Supply Voltage	V_{CC}	Operating, $T_J < 165^\circ C$	LH and UA packages	3.0	–	24	V
		Operating, $T_J < 165^\circ C$	UC package	4.33	–	24	V
Undervoltage Lockout [4]	$V_{CC(UV)DIS}$	After power-on, as V_{CC} increases, output is forced to POS until this voltage is reached	LH and UA packages	–	2.6	–	V
			UC package	–	3.5	–	V
	$V_{CC(UV)EN}$	After POK, when V_{CC} drops below this voltage, output is forced to POS	LH and UA packages	–	2.3	–	V
			UC package	–	3.2	–	V
Supply Current	$I_{CC(L1)}$			5	–	6.9	mA
	$I_{CC(L2)}$			2	–	5	mA
	$I_{CC(H)}$			12	–	17	mA
	I_{SAFE}	Safe current state. Indicates overtemperature or device configuration error.		–	–	2	mA
Output Slew Rate	dI/dt	No bypass capacitor; C_L [5] = 20 pF	LH and UA packages	–	50	–	mA/ μs
		$C_{BYP} = 100$ nF; C_L [5] = 20 pF		–	0.22	–	mA/ μs
		Internal bypass capacitor; C_L [5] = 20 pF	UC package	–	0.22	–	mA/ μs
Power-On Time [6]	t_{PO}	$V_{CC} \geq V_{CC(min)}$, $B > B_{OP(max)}$, $B < B_{RP(min)}$	–	–	70	μs	
Power-On State [7]	POS	$t < t_{PO}$, $V_{CC} \geq V_{CC(UV)EN}$		$I_{CC(H)}$		mA	
Chopping Frequency	f_C		–	800	–	kHz	
Output Jitter (p-p)		1 kHz square wave signal	–	5	–	μs	
ON-BOARD PROTECTION							
Supply Zener Clamp Voltage	V_Z	$I_{CC} = I_{CC(H)} + 1$ mA, $T_A = 25^\circ C$	40	–	–	V	
Reverse Supply Zener Clamp Voltage	V_{RZ}	$I_{CC} = -1$ mA	–	–	-23	V	
Overtemperature Shutdown	T_{SD}	Temperature increasing	–	205	–	$^\circ C$	
Overtemperature Hysteresis	T_{JHYS}		–	25	–	$^\circ C$	

[3] Typical data is at $T_A = 25^\circ C$ and $V_{CC} = 12$ V unless otherwise noted; for design information only.

[4] UC minimum V_{CC} is higher to accommodate voltage drop in the internal series resistor. UC package minimum V_{CC} is higher to accommodate voltage drop in the internal series resistor. This also affects the $V_{CC(UV)}$.

[5] C_L – scope capacitance.

[6] Measured from $V_{CC} \geq V_{CC(MIN)}$ to valid output.

[7] Power-on state is defined only when V_{CC} slew rate 1 V/s or greater

MAGNETIC CHARACTERISTICS: Valid over full operating voltage and ambient temperature ranges for $T_J < T_{J(max)}$ and $C_{BYP} = 0.01 \mu F$, unless otherwise specified

Characteristics	Symbol	Magnetic Switchpoint Option	Temperature Coefficient	Test Conditions	Min.	Typ. [8]	Max.	Unit [9]
Operate Point	B_{OP}	-0	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	5	–	80	G
		-1	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	5	–	40	G
Release Point	B_{RP}	-0	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	–80	–	–5	G
		-1	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	–40	–	–5	G
Hysteresis	B_{HYS}	-0	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	40	–	110	G
		-1	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	15	40	65	G
Switchpoint Temperature Coefficient		All	A – Flat	$T_A = -40^\circ C$ to $150^\circ C$	–	0	–	%/ $^\circ C$

[8] Typical data is at $T_A = 25^\circ C$ and $V_{CC} = 12 V$, unless otherwise noted; for design information only.

[9] Magnetic flux density, B, is indicated as a negative value for north-polarity magnetic fields, and a positive value for south-polarity magnetic fields.

THERMAL CHARACTERISTICS: May require derating at maximum conditions; see application information

Characteristic	Symbol	Test Conditions*	Value	Unit
Package Thermal Resistance	$R_{\theta JA}$	Package LH, on 1-layer PCB based on JEDEC standard	228	$^{\circ}\text{C}/\text{W}$
		Package LH, on 2-layer PCB with 0.463 in. ² of copper area each side	110	$^{\circ}\text{C}/\text{W}$
		Package UA, on 1-layer PCB with copper limited to solder pads	165	$^{\circ}\text{C}/\text{W}$
		Package UC, on 1-layer PCB with copper limited to solder pads	270	$^{\circ}\text{C}/\text{W}$

CHARACTERISTIC PERFORMANCE DATA

FUNCTIONAL DESCRIPTION

Functional Safety

The APS12400 was designed in accordance with the international standard for automotive functional safety, ISO 26262:2011 (pending assessment). This product achieves an ASIL (Automotive Safety Integrity Level) rating of ASIL A according to the standard. The APS12400 is classified as a SEoOC (Safety Element out of Context) and can be easily integrated into safety-critical systems requiring higher ASIL ratings that incorporate external diagnostics or use measures such as redundancy. Safety documentation will be provided to support and guide the integration process. Contact your local FAE for A²-SIL™ documentation: www.allegromicro.com/ASIL.

The APS12400 has internal diagnostics to check the voltage supply (an undervoltage lockout regulator) and to detect overtemperature conditions. See the Diagnostics section for more information.

Operation

The APS12400 devices are two-wire unipolar planar Hall-effect latches. The user can select a device that respond to a north or south magnetic field. There is a choice of two output current levels, $I_{CC(L)}$ and $I_{CC(L2)}$, and the user can determine which current state is applied, $I_{CC(L)}$ or $I_{CC(H)}$, when the magnetic field is greater than B_{OP} or less than B_{RP} .

The difference between the magnetic operate and release points is called the hysteresis of the device, B_{HYS} . Hysteresis allows clean switching of the output even in the presence of external mechanical vibration and electrical noise.

Figure 1 shows the potential configuration options for the APS12400. The direction of the applied magnetic field is perpendicular to the branded face for the APS12400. See Figure 2 for an illustration.

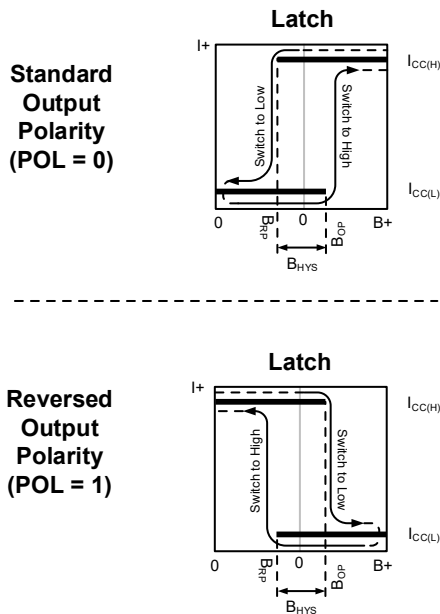

Figure 1: Unipolar Hall Latch Magnetic and Output Current Polarity Options

B- indicates increasing north polarity magnetic field strength, and B+ indicates increasing south polarity magnetic field strength.

Figure 2: Magnetic Sensing Orientations APS12400 LH (Panel A), UA (Panel B), and UC (Panel C)

Power-On Behavior

The APS12400 has an internal voltage regulator with undervoltage lockout. As the device powers up, it stays in the power-on state (POS) of $I_{CC(H)}$ until the supply voltage exceeds $V_{CC(UV)DIS}$. After t_{PO} , the current consumption is $I_{CC(L)}$ or $I_{CC(H)}$, according to the magnetic field and the device configuration, as shown in Figure 1.

Similarly, when the supply voltage decreases, the device returns to the power on state (POS) when the supply voltage drops below $V_{CC(UV)EN}$, as shown in Figure 3.

When the device powers on in the hysteresis range (less than B_{OP} and higher than B_{RP}), the output corresponds to the power-on state. In this case, the correct state is attained after the first excursion beyond B_{OP} or B_{RP} .

Figure 3: Power-On/UVLO Behavior

Diagnostic Features

When properly supplied, APS12400 always has current flowing at a specified level: either $I_{CC(H)}$, $I_{CC(L)}$, or I_{SAFE} . Any current outside of these narrow ranges is a fault condition. If there is a short, current increases so that $I_{CC} > I_{CC(H)} (max)$, outside the valid $I_{CC(H)}$ range. If there is an open, the current lowers below the $I_{CC(L)} (min)$, outside the valid output current range. In this way, connectivity issues between the ECU and the sensor can easily be detected.

Additionally, the APS12400 has an overtemperature feature: if the junction temperature increases beyond T_{SD} , then the current is reduced to I_{SAFE} . The device current also changes to I_{SAFE} if there is an error in the device configuration which is checked at power-on and after an overtemperature event.

Any value of I_{CC} between the allowed ranges for $I_{CC(H)}$ and $I_{CC(L)}$ indicates a general fault condition.

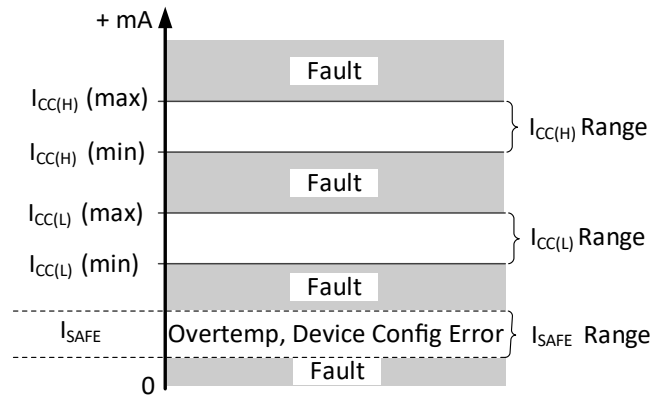

Figure 4: Interpreting I_{CC} for System-Level Diagnostics

Temperature Coefficient and Magnet Selection

The APS12400 allows the user to select the magnetic temperature coefficient to compensate for drifts of SmCo, NdFeB, and ferrite magnets over temperature—as indicated in the specifications table on page 5. This compensation improves the magnetic system performance over the entire temperature range. For example, the magnetic field strength from ferrite decreases as the temperature increases from 25°C to 150°C. This lower magnetic field strength means that a lower switching threshold is required to maintain switching at the same distance from the magnet to the sensor. Correspondingly, higher switching thresholds are required at cold temperatures, as low as -40°C, due to the higher magnetic field strength from the ferrite magnet. The APS12400 compensates the switching thresholds over temperature as described above. It is recommended that system designers evaluate their magnetic circuit over the expected operating temperature range to ensure the magnetic switching requirements are met.

For example, the typical ferrite compensation is $-0.2\%/^{\circ}C$. With a 25°C temperature B_{OP} switchpoint of 80 G, the switchpoint changes nominally by $-0.2\%/^{\circ}C \times 80 \times (150^{\circ}C - 25^{\circ}C) = -20$ G to 80 G - 20 G = 60 G at 150°C. And at -40°C, the switchpoint changes by $-0.2\%/^{\circ}C \times 80 \times (-40^{\circ}C - 25^{\circ}C) = 10$ G to 80 G + 10 G = 90 G.

Applications

For the LH and UA packages, an external bypass capacitor (from 0.01 μF to 0.1 μF) should be connected (in close proximity to the Hall element) between the supply and ground of the device to reduce both external noise and noise generated by the chopper stabilization. Some applications may require additional EMC immunity which is achieved with an enhanced protection circuit. For example, increasing the bypass capacitor from 0.01 μF to 0.1 μF improves immunity to Powered ESD (ISO 10605) and Direct Capacitive Coupling.

A series resistor and a 0.1 μF bypass capacitor is integrated into the UC package, making it easy to achieve an EMC-robust design with no external components or PCB required.

Note that the bypass capacitor selection directly affects the slew rate. See the Electrical Characteristics table for the typical slew rate with 0.1 μF bypass capacitor. A 0.01 μF bypass capacitor slew rate is ten times faster.

Typical application circuits are shown in “Figure 5: Typical Application Circuits” on page 13.

Figure 5: Typical Application Circuits

Chopper Stabilization Technique

A limiting factor for switchpoint accuracy when using Hall-effect technology is the small-signal voltage developed across the Hall plate. This voltage is proportionally small relative to the offset that can be produced at the output of the Hall sensor. This makes it difficult to process the signal and maintain an accurate, reliable output over the specified temperature and voltage range. Chopper stabilization is a proven approach used to minimize Hall offset.

The technique, dynamic quadrature offset cancellation, removes key sources of the output drift induced by temperature and package stress. This offset reduction technique is based on a signal modulation-demodulation process. “Figure 6: Model of Chopper Stabilization Circuit (Dynamic Offset Cancellation)” illustrates how it is implemented.

The undesired offset signal is separated from the magnetically induced signal in the frequency domain through modulation. The

subsequent demodulation acts as a modulation process for the offset causing the magnetically induced signal to recover its original spectrum at baseband while the DC offset becomes a high-frequency signal. Then, using a low-pass filter, the signal passes while the modulated DC offset is suppressed. Allegro’s innovative chopper-stabilization technique uses a high-frequency clock.

The high-frequency operation allows a greater sampling rate that produces higher accuracy, reduced jitter, and faster signal processing. Additionally, filtering is more effective and results in a lower noise analog signal at the sensor output. Devices such as the APS12400 that use this approach have an extremely stable quiescent Hall output voltage, are immune to thermal stress, and have precise recoverability after temperature cycling. This technique is made possible through the use of a BiCMOS process which allows the use of low offset and low noise amplifiers in combination with high-density logic and sample-and-hold circuits.

Figure 6: Model of Chopper Stabilization Circuit (Dynamic Offset Cancellation)

POWER DERATING

The device must be operated below the maximum junction temperature, T_J (max). Reliable operation may require derating supplied power and/or improving the heat dissipation properties of the application.

Thermal Resistance (junction to ambient), $R_{\theta JA}$, is a figure of merit summarizing the ability of the application and the device to dissipate heat from the junction (die), through all paths to ambient air. $R_{\theta JA}$ is dominated by the Effective Thermal Conductivity, K , of the printed circuit board which includes adjacent devices and board layout. Thermal resistance from the die junction to case, $R_{\theta JC}$, is a relatively small component of $R_{\theta JA}$. Ambient air temperature, T_A , and air motion are significant external factors in determining a reliable thermal operating point.

The following three equations can be used to determine operation points for given power and thermal conditions.

$$P_D = V_{IN} \times I_{IN} \quad (1)$$

$$\Delta T = P_D \times R_{\theta JA} \quad (2)$$

$$T_J = T_A + \Delta T \quad (3)$$

For example, given common conditions: $T_A = 25^\circ\text{C}$, $V_{CC} = 12\text{ V}$, $I_{CC} = 6\text{ mA}$, and $R_{\theta JA} = 110^\circ\text{C/W}$ for the LH package, then:

$$P_D = V_{CC} \times I_{CC} = 12\text{ V} \times 6\text{ mA} = 72\text{ mW}$$

$$\Delta T = P_D \times R_{\theta JA} = 72\text{ mW} \times 110^\circ\text{C/W} = 7.92^\circ\text{C}$$

$$T_J = T_A + \Delta T = 25^\circ\text{C} + 7.92^\circ\text{C} = 32.92^\circ\text{C}$$

Determining Maximum V_{CC}

For a given ambient temperature, T_A , the maximum allowable power dissipation as a function of V_{CC} can be calculated. P_D (max) represents the maximum allowable power level without exceeding T_J (max) at a selected $R_{\theta JA}$ and T_A .

Example: V_{CC} at $T_A = 150^\circ\text{C}$, package UA, using low-K PCB. Using the worst-case ratings for the device, specifically: $R_{\theta JA} = 165^\circ\text{C/W}$, T_J (max) = 165°C , V_{CC} (max) = 24 V , and I_{CC} (max) =

17 mA , calculate the maximum allowable power level, P_D (max). First, using equation 3:

$$\Delta T (max) = T_J (max) - T_A = 165^\circ\text{C} - 150^\circ\text{C} = 15^\circ\text{C}$$

This provides the allowable increase to T_J resulting from internal power dissipation. Then, from equation 2:

$$P_D (max) = \Delta T (max) \div R_{\theta JA} = 15^\circ\text{C} \div 165^\circ\text{C/W} = 91\text{ mW}$$

Finally, using equation 1, solve for maximum allowable V_{CC} for the given conditions:

$$V_{CC} (est) = P_D (max) \div I_{CC} (max) = 91\text{ mW} \div 17\text{ mA} = 5.4\text{ V}$$

The result indicates that, at T_A , the application and device can dissipate adequate amounts of heat at voltages $\leq V_{CC}$ (est).

If the application requires $V_{CC} > V_{CC(est)}$ then $R_{\theta JA}$ must be improved. This can be accomplished by adjusting the layout, PCB materials, or by controlling the ambient temperature.

Determining Maximum T_A

In cases where the V_{CC} (max) level is known, and the system designer would like to determine the maximum allowable ambient temperature T_A (max), for example, in a worst-case scenario with conditions V_{CC} (max) = 24 V , I_{CC} (max) = 17 mA , and $R_{\theta JA} = 228^\circ\text{C/W}$ for the LH package using equation 1, the largest possible amount of dissipated power is:

$$P_D = V_{IN} \times I_{IN}$$

$$P_D = 24\text{ V} \times 17\text{ mA} = 408\text{ mW}$$

Then, by rearranging equation 3 and substituting with equation 2:

$$T_A (max) = T_J (max) - \Delta T$$

$$T_A (max) = 165^\circ\text{C} - (408\text{ mW} \times 228^\circ\text{C/W})$$

$$T_A (max) = 165^\circ\text{C} - 93^\circ\text{C} = 72^\circ\text{C}$$

Finally, note that the T_A (max) rating of the device is 150°C and performance is not guaranteed above this temperature for any power level.

Package LH, 3-Pin SOT23W

- For reference only; not for tooling use (reference DWG-0000367, Rev. 2).
 Dimensions in millimeters.
 Dimensions exclusive of mold flash, gate burrs, and dambar protrusions.
 Exact case and lead configuration at supplier discretion within limits shown.
- Active Area Depth, 0.28 ± 0.04 mm
 - Reference land pattern layout
 All pads a minimum of 0.20 mm from all adjacent pads; adjust as necessary to meet application process requirements and PCB layout tolerances
 - Branding scale and appearance at supplier discretion
 - Hall element, not to scale

Line 1 = Three digit assigned brand number

Package UA, 3-Pin SIP

Package UC, 3-Pin SIP

For Reference Only – Not for Tooling Use

(Reference DWG-0000409, Rev. 2)
 Dimensions in millimeters – NOT TO SCALE
 Dimensions exclusive of mold flash, gate burs, and dambar protrusions
 Exact case and lead configuration at supplier discretion within limits shown

REVISION HISTORY

Number	Date	Description
–	March 23, 2018	Initial release
1	September 11, 2018	Updated Selection Guide table (page 3), Corrected supply current values and plots (pages 6 and 9); added UC package availability footnote to Complete Part Number Format diagram and Selection Guide table (page 2-3)
2	April 1, 2019	Updated ASIL status (page 1 and 10)
