

SED1345

CMOS VIDEO - LCD INTERFACE (VLI)

- 8 Levels of Gray Scale

■ DESCRIPTION

The SED1345 is a video-LCD interface (VLI) developed for a dot matrix LCD display system. It converts separate video signals for CRT display into signals for LCD.

The SED1345 can use a conventional LCD driver to display data at eight gradation levels corresponding to digital video signal data I, R, G and B. The on-chip color pallet for gradation display allows setting of any gradation level for each of the 16 colors on the CRT display.

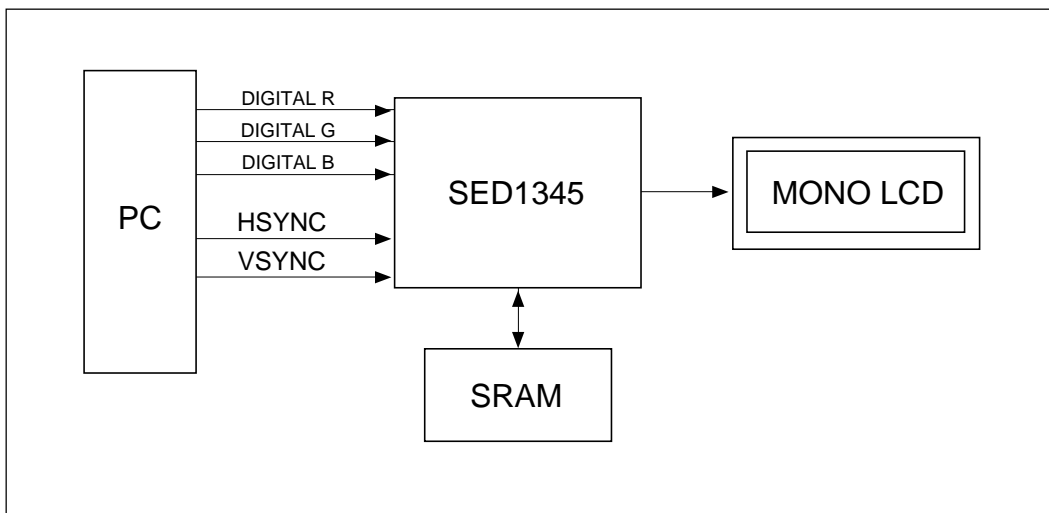

A 640 × 480 dot panel with eight gradation levels can be driven using only 256K bits of frame buffer memory. This leads to a significant reduction in system memory cost.

With the SED1345, the user can select not only a display size but a display area to configure a display panel of flexible size from 640 × 200 dots to 640 × 480 dots (maximum). These LCD display sizes are compatible with various display modes such as CGA® and EGA®.

■ FEATURES

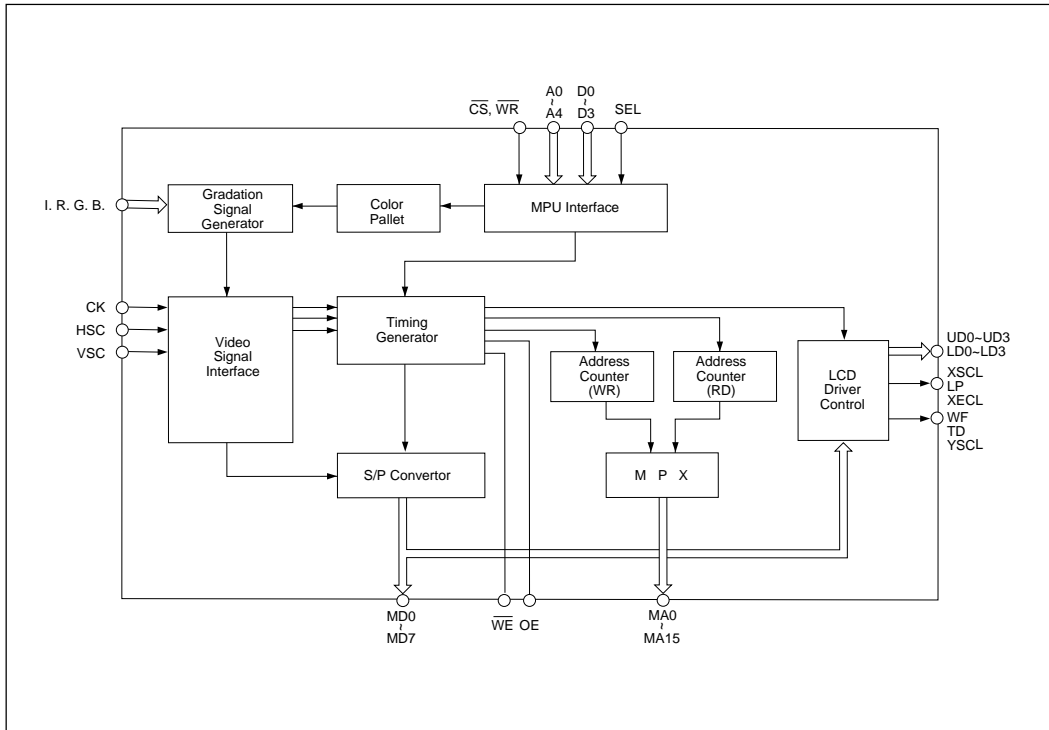

- Low-power CMOS technology
- TTL-compatible signal input
- LCD display size:
 - Horizontal: 640 dots
 - Vertical: 200, 350, 400, 480 lines
- Supports 8 levels of gray shade
- Supports single panel and dual panel
- LCD driver interface: 4 bits bus and 4 bits × 2 bus
- Register programming by 4 bits
- Maximum dot clock: 30 MHz
- Supports 40KB SRAM frame buffer
- Duty cycle: 1/200 to 1/480
- Power-on clear function
- Single power supply: 5V ± 5%
- Package: QFP5-80 pin (FOA)
