

W9451GBDA-6

512MB (64M ´ 64) DDR SDRAM DIMM

1. GENERAL DESCRIPTION

The W9451GBDA is a 512MB Double Data Rate Synchronous Dynamic RAM (DDR SDRAM) memory modules. It is organized in a 64M x 64 bit configuration using eight pieces of Winbond W942508AH (32M x 8 bits) DDR SDRAMs and assembled on a JEDEC standard 184-pin DIMM PCB.

To provide high data bandwidth, W9451GBDA uses a double data rate architecture to transfer two data words per clock cycle and delivers a data bandwidth of up to 2.7G (DDR333) bytes per second. It is ideal for high performance systems that require fast data transfer memory modules.

By reading the Serial Presence-Detect (SPD), the system can identify the module type, DDR SDRAM timing parameters and other necessary information to optimize system setting and maximize its performance.

5. PIN DESCRIPTIONS

PIN	NAME	FUNCTION DESCRIPTION
CLKn, $\overline{\text{CLKn}}$	Clock Input	CLKn and $\overline{\text{CLKn}}$ are differential clock inputs. All input command signals are sampled at the positive edge of CLK(except for DQ, DM and CKE).
$\overline{\text{CSn}}$	Chip select	Disable or enable the command decoder. When command decoder is disabled, new command is ignored and previous operation continues.
CKEn	Clock Enable	CKE controls the clock activation and deactivation. When CKE is low, Power Down mode, Suspend mode, or Self-Refresh mode is entered.
A0 – A12	Address	Multiplexed pins for row and column address. Row address: A0 – A12. Column address: A0 – A9.
BA0 – BA1	Bank Select Address	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
$\overline{\text{RAS}}$	Row Address Strobe	Command input. When sampled at the rising edge of the clock, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ define the operation to be executed.
$\overline{\text{CAS}}$	Column Address Strobe	Referred to $\overline{\text{RAS}}$
$\overline{\text{WE}}$	Write Enable	Referred to $\overline{\text{RAS}}$
DM0 – DM7	Input/Output Mask	The output buffer is placed at Hi-Z when DM is sampled high in read cycle. In write cycle, sampling DM high will block the write data.
DQ0 – DQ63	Data Input/Output	Multiplexed pins for data output and input
DQS0 – DQS7	Data Strobe Input/Output	Output with read data, input with write data. DQS is edge-aligned with read data, centered in write data.
VDD	Power (+2.5V)	Power supply (2.5V).
VSS	Ground	Ground
VREF	Reference Voltage	SSTL-2 Reference voltage
VDDSPD	SPD Power	Separated power supply for SPD EEPROM (2.3V – 3.6V)
SCL	Serial Clock	Clock for serial presence detection
SDA	Serial Data I/O	Data line for serial presence detection
SAn	SPD Address Line	System assigned address (SA0 – SA2) to identify different memory module in a system board.
NC	No Connection	No connection

A.C. TEST LOAD (A)

Notes:

- (1) Conditions outside the limits listed under "ABSOLUTE MAXIMUM RATINGS" may cause permanent damage to the device.
- (2) All voltages are referenced to V_{SS} , V_{SSQ} .
- (3) Peak to peak AC noise on V_{REF} may not exceed $\pm 2\%$ of $V_{REF} (DC)$.
- (4) $V_{OH} = 1.95V$, $V_{OL} = 0.35V$
- (5) $V_{OH} = 1.9V$, $V_{OL} = 0.4V$
- (6) The values of $I_{OH}(DC)$ is based on $V_{DDQ} = 2.4V$ and $V_{TT} = 1.19V$. The values of $I_{OL}(DC)$ is based on $V_{DDQ} = 2.4V$ and $V_{TT} = 1.11V$.
- (7) These parameters depend on the cycle rate and these values are measured at a cycle rate with the minimum values of t_{CK} and t_{RC} .

- (8) V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF} .
- (9) These parameters depend on the output loading. Specified values are obtained with the output open.
- (10) Transition times are measured between $V_{IH \min.(AC)}$ and $V_{IL \max.(AC)}$. Transition (rise and fall) of input signals have a fixed slope.
- (11) If the result of nominal calculation with regard to t_{CK} contains more than one decimal place, the result is rounded up to the nearest decimal place. i.e., $t_{DQSS} = 0.75 \times t_{CK}$, $t_{CK} = 7.5 \text{ nS}$, $0.75 \times 7.5 \text{ nS} = 5.625 \text{ nS}$ is rounded up to 5.6 nS.
- (12) V_x is the differential clock cross point voltage where input timing measurement is referenced.
- (13) V_{ID} is magnitude of the difference between CLK input level and $\overline{CLK}$ input level.
- (14) V_{ISO} means $\{V_{ICK}(CLK) + V_{ICK}(\overline{CLK})\}/2$.
- (15) Refer to the figure below.
- (16) t_{AC} and t_{DQCK} depend on the clock jitter. These timing are measured at stable clock.

- (17) t_{AC} and t_{DQCK} depend on the clock jitter. These timing are measured at stable clock.

14. SERIAL PRESENCE DETECT EEPROM

The Serial Presence Detect (SPD) function is implemented by using a 2,408-bit EEPROM component. This nonvolatile storage device contains those data for identifying the module type and various SDRAM organizations and timing parameters. System read operations to the EEPROM device occur using the DIMM SCL(clock) and SDA (data) signals, together with SA(2:0) which provide the EEPROM Device Address.
