Features

- UL Recognized: UL1557 File E345245
- 600V-5A (Trench Shielded Planar Gate IGBT)
- 3 phase Inverter module including HVIC drivers
- Built-in bootstrap diodes with integrated current-limiting resistor
- Control supply under-voltage lockout protection (UVLO)
- Over-temperature (OT) protection (V_{OT}) – pin open
- Temperature monitoring (V_{OT}) – 10kΩ resistor connection
- Short-circuit current protection (C_{SC})
- Fault out signal (V_{FO}) corresponding to SC, UV and OT fault
- Wide input interface (3-18V), Schmitt trigger receiver circuit (Active High)
- Isolation ratings of 2000Vrms/min

Applications

- AC 100-240Vrms class low power motor drives like refrigerator, dishwasher, fan motor, washing machine, and air-conditioner

Notes:

2. Short-circuit protection works only for low sides.
3. The IPM does not shutdown IGBTs and output fault signal automatically when temperature rises excessively. When temperature exceeds the protective level that the user defined, the controller (MCU) should stop the IPM. Temperature of LVIC vs. V_{OT} output characteristics is described in Figure 3.
4. When the LVIC temperature exceeds OT Trip temperature level (OT_T), OT protection is triggered and fault outputs.
5. Fault signal (F_O) outputs when SC, UV or OT protection is triggered. F_O pulse width is different for each protection mode. At SC failure, F_O pulse width is a fixed width (minimum 20µs), but at UV or OT failure, F_O outputs continuously until recovering from UV or OT state. (But minimum F_O pulse width is 20µs).
6. The characteristics of bootstrap diodes are described in Figure 2.

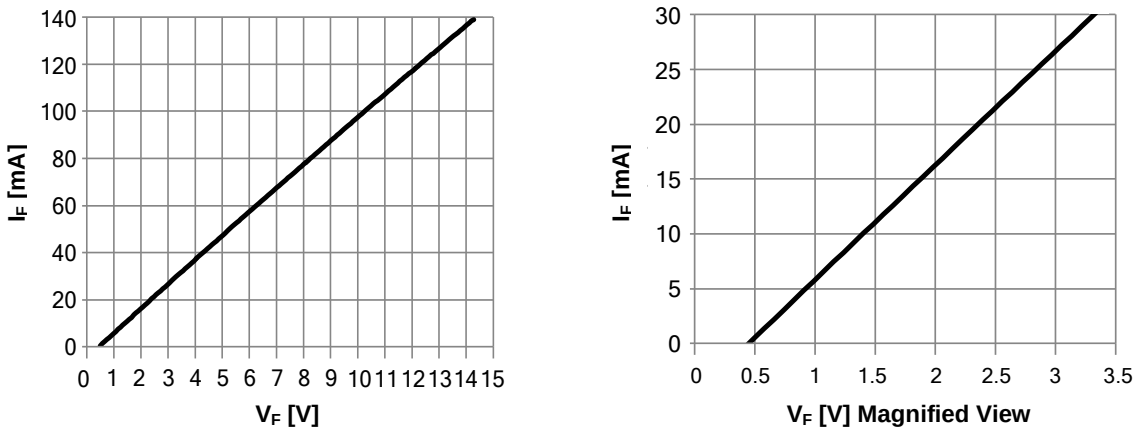

Figure 2. Built-in Bootstrap Diode V_F-I_F Characteristic (@T_A=25°C)

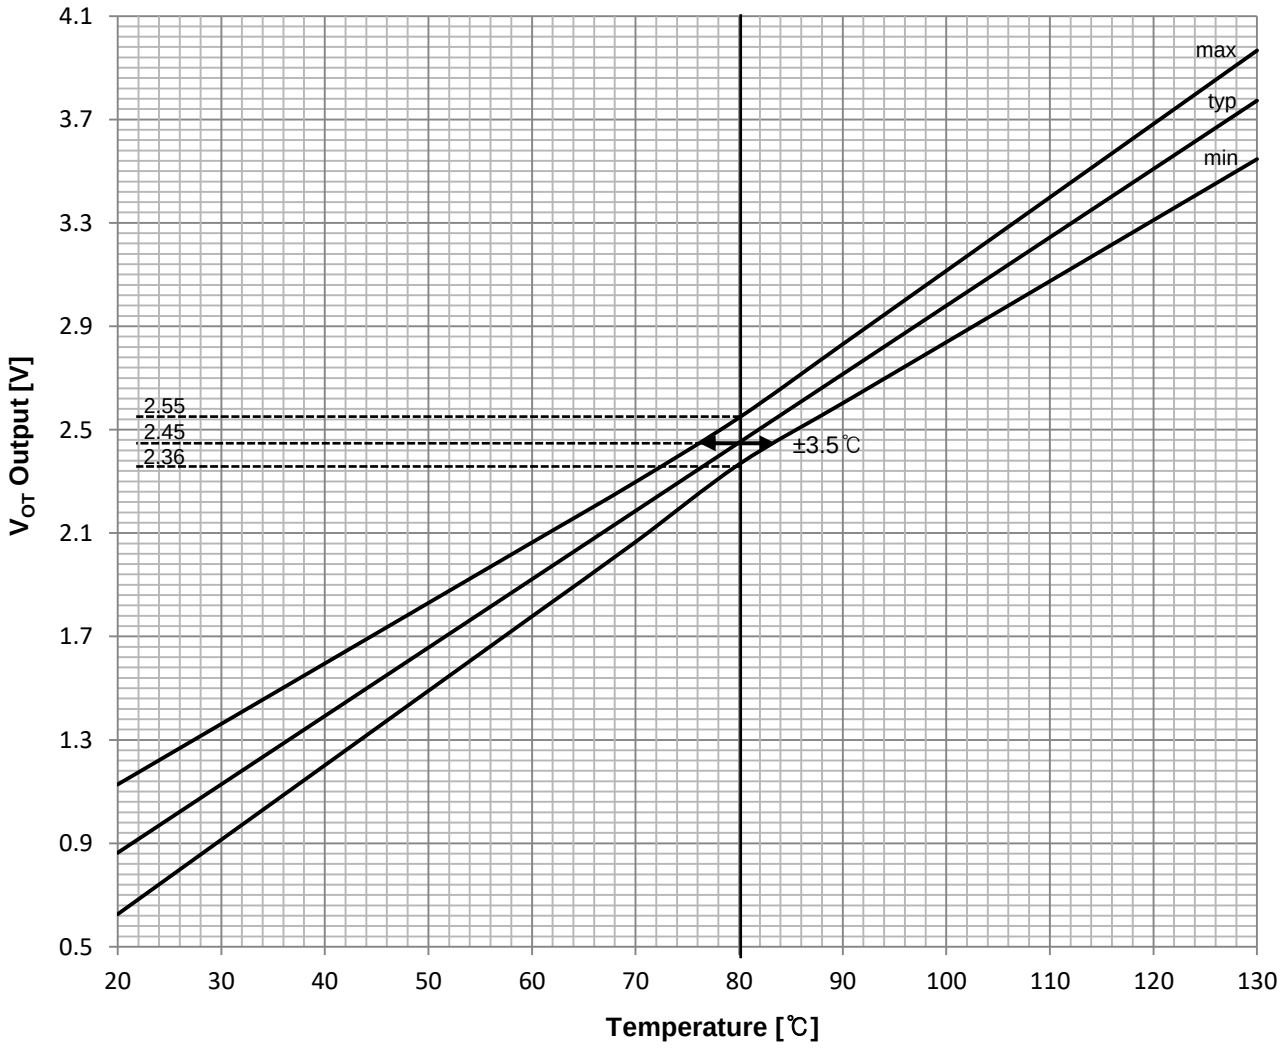

Figure 3. Temperature of LVIC vs. V_{OT} Output Characteristics

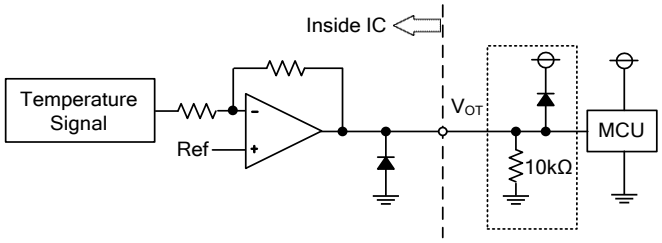

Figure 4. V_{OT} Output Circuit

(1) Connect 10kΩ to V_{OT} pin if temperature monitoring function is utilized; otherwise if the V_{OT} pin is left unconnected, the internal over-temperature shutdown function is used instead.

(2) In the case of using V_{OT} with low voltage controller like 3.3V MCU, V_{OT} output might exceed control supply voltage 3.3V when temperature rises excessively. If system uses low voltage controller, it is recommended to insert a clamp diode between control supply of the controller and V_{OT} output for preventing over voltage destruction.

Time Charts of the IPM Protective Function

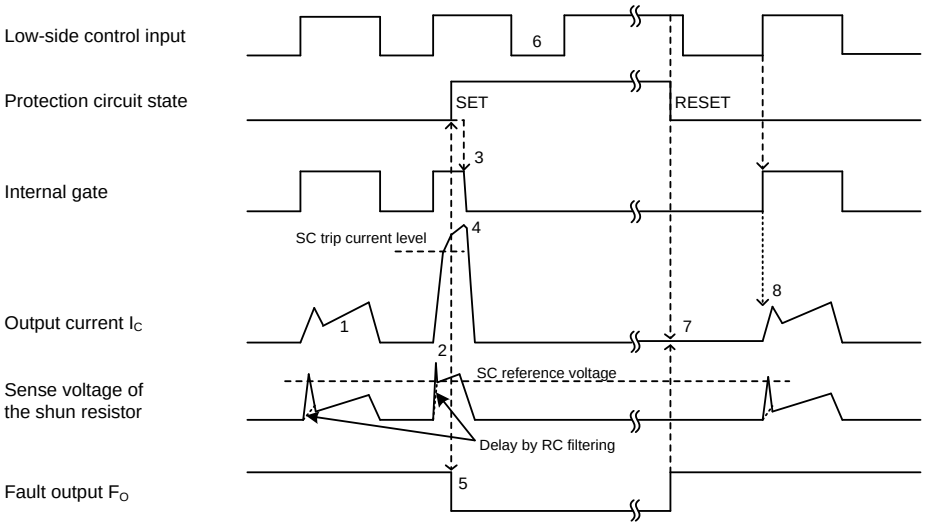

Figure 6. Short-Circuit Protection
(Low-side Operation Only with the External Shunt Resistor and RC Filter)

(1) Normal operation: IGBT turns on and outputs current.
(2) Short-circuit current detection (SC triggered).
(3) All low-side IGBTs' gates are hard interrupted.
(4) All low-side IGBTs turn OFF.
(5) F_O output time (t_{FO})=minimum 20μs.
(6) Input = "L" : IGBT OFF.
(7) Fault output finishes, but output current will not turn on until next ON signal (L→H).
(8) Normal operation: IGBT turns on and outputs current.

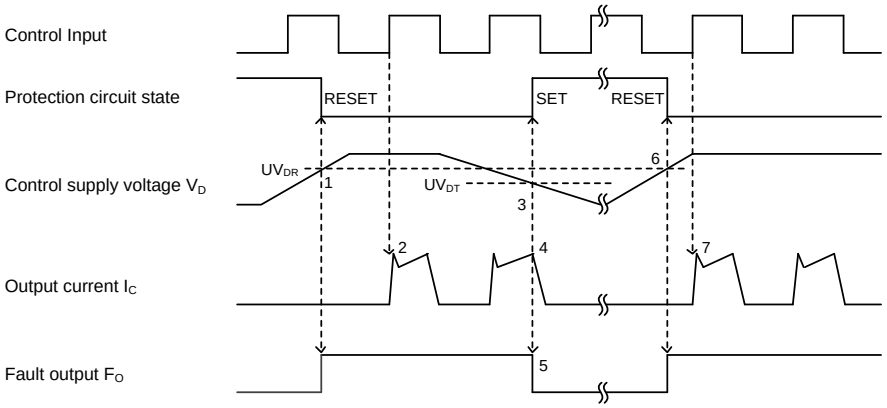

Figure 7. Under-Voltage Protection (Low-side, UV_D)

(1) Control supply voltage V_D exceeds under voltage reset level (UV_{DR}), but IGBT turns on by next ON signal (L→H).
(2) Normal operation: IGBT turns on and outputs current.
(3) V_D level drops to under voltage trip level (UV_{DT}).
(4) All low-side IGBTs turn OFF regardless of control input condition.
(5) F_O output time (t_{FO})=minimum 20μs, and F_O stays low as long as V_D is below UV_{DR}.
(6) V_D level reaches UV_{DR}.
(7) Normal operation: IGBT turns on and outputs current.

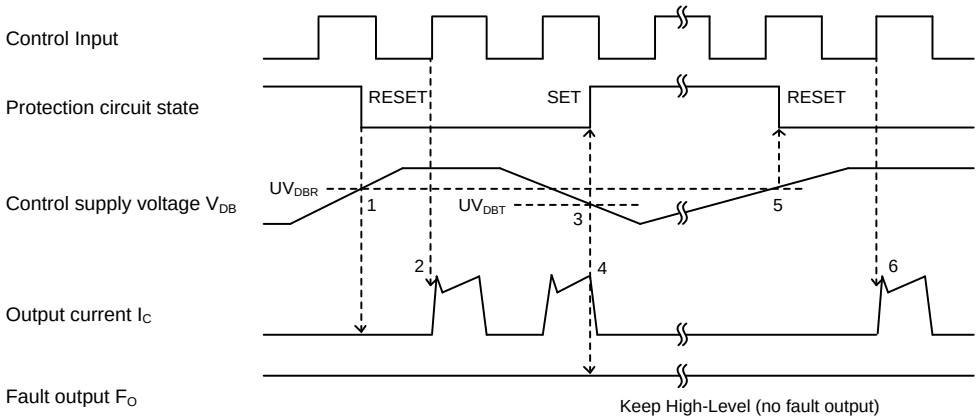

Figure 8. Under-Voltage Protection (High-side, UV_{DB})

(1) Control supply voltage V_{DB} rises. After the voltage reaches under voltage reset level UV_{DBR}, IGBT turns on by next ON signal (L→H).
(2) Normal operation: IGBT turns on and outputs current.
(3) V_{DB} level drops to under voltage trip level (UV_{DBT}).
(4) All high-side IGBTs turn OFF regardless of control input condition, but there is no F_O signal output.
(5) V_{DB} level reaches UV_{DBR}.
(6) Normal operation: IGBT turns on and outputs current.

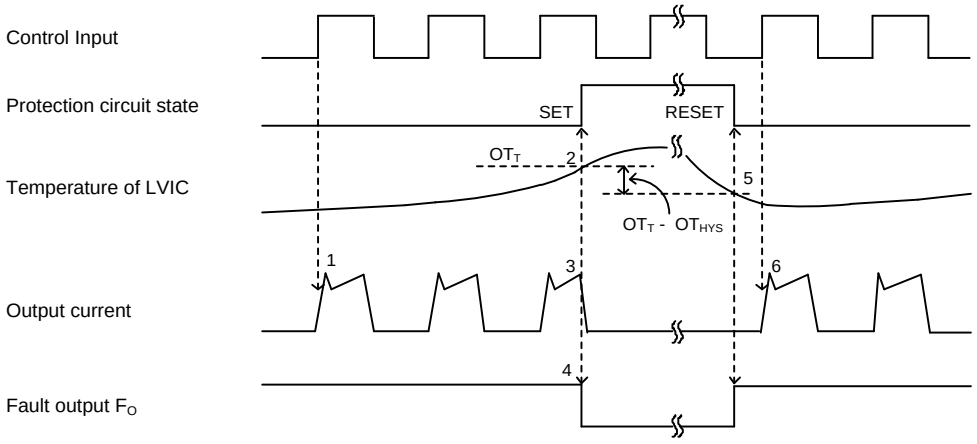

Figure 9. Over-Temperature Protection (Low-side, Detecting LVIC Temperature)

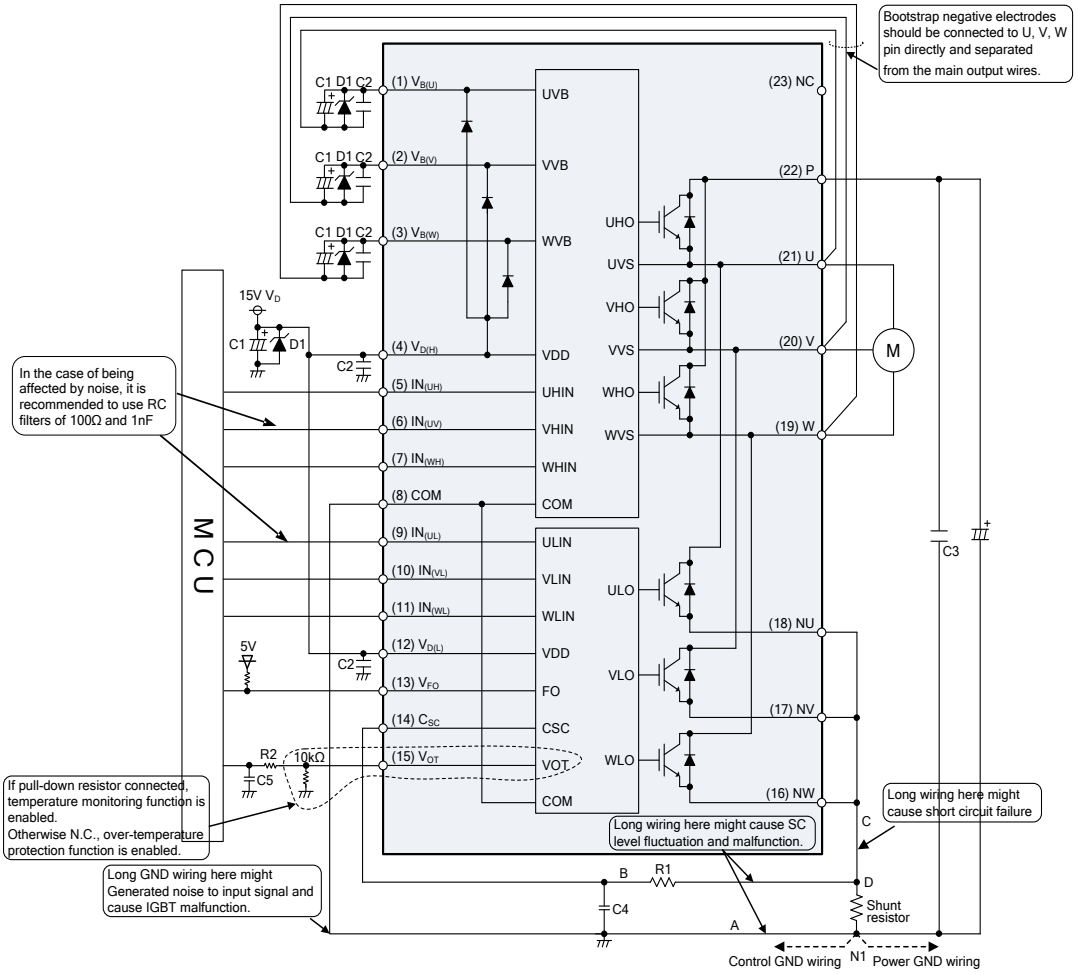
(1) Normal operation: IGBT turns on and outputs current.
(2) LVIC temperature exceeds over-temperature trip level (OT_T).
(3) All low-side IGBTs turn off regardless of control input condition.
(4) F_O output time (t_{FO})=minimum 20µs, and F_O stays low as long as LVIC temperature is over OT_T.
(5) LVIC temperature drops to over-temperature reset level (OT_T-OT_{HYS}).
(6) Normal operation: IGBT turns on by the next ON signal (L→H).

Example of Application Circuit



(1) If the control GND is connected with the power GND by common broad pattern, it may cause malfunction by power GND fluctuation. It is recommended to connect the control GND and power GND at a single point (N1), near the terminal of the shunt resistor.

(2) A zener diode D1 (24V/1W) is recommended between each pair of control supply pins to prevent surge destruction.

(3) Prevention of surge destruction can further be improved by placing the bus capacitor as close to pin P and N1 as possible. Generally a 0.1-0.22μF snubber capacitor C3 between the P-N1 terminals is recommended.

(4) Selection of the R1*C4 filter components for short-circuit protection is recommended to have tight tolerance, and is temperature-compensated type. The R1*C4 time constant should be set such that SC current is shut down within 2μs; (typically 1.5-2μs). R1 and C4 should be placed as close as possible to the C_{SC} pin. SC interrupting time may vary with layout patterns and components selection, therefore thorough evaluation in the system is necessary.

(5) Tight tolerance and temperature-compensated components are also recommended when selecting the R2*C5 filter for V_{OT}. The R2*C5 time constant should be set such that V_{OT} is immune to noise. Recommended values of R2 and C5 are 2kΩ and 10nF.

(6) To prevent malfunction, traces A, B, and C should be as short as possible.

(7) It is recommended that all capacitors are mounted as close to the IPM as possible. (C1: electrolytic type with good temperature and frequency characteristics. C2: ceramic type with 0.1-2μF, good temperature, frequency and DC bias characteristics.)

(8) Input drives are active-high. There is a minimum 3.5kΩ pull-down resistor in the input circuit of IC. To prevent malfunction, the layout to each input should be as short as possible. When using RC coupling circuit, make sure the input signal levels meet the required turn-on and turn-off threshold voltages.

(9) V_{FO} output is open drain type. It should be pulled up to MCU or control power supply (max= 5±0.5V), limiting the current (I_{FO}) to no more than 1mA. I_{FO} is estimated roughly by the formula of control power supply voltage divided by pull-up resistor. For example, if control supply is 5V, a 10kΩ (over 5kΩ) pull-up resistor is recommended.

(10) Direct drive of the IPM from the MCU is possible without having to use opto-coupler or isolation transformer.

(11) The IPM may malfunction and erroneous operations may occur if high frequency noise is superimposed to the supply line. To avoid such problems, line ripple voltage is recommended to have dV/dt ≤ ±1V/μs, and Vripple ≤ 2Vp-p.

(12) It is not recommended to use the IPM to drive the same load in parallel with another IPM or inverter types.

LIFE SUPPORT POLICY

ALPHA AND OMEGA SEMICOND UCTOR PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.

2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
