

TONE RINGER ICs

TONE RINGER FOR TELEPHONE SET

FEATURES

- The Tone Ringer with a built-in Ring Detector. It supplies about 5V DC voltage while tone ring outputs so it is convenient to count the call.
- Since operating voltage is high, output sound pressure level can be made high.
- Initiation supply voltage is low. (12.4V)
- Initiation current consumption can be varied with external resistance.
- Very few external parts

OPERATING INSTRUCTION

1. Initiation supply voltage (V_{Si}), sustaining supply voltage (V_{Sus}), and current consumption (I_{CC})

Fig.1

2. Method of using I_{cont} terminal [pin 2 (2)]

In TA31076S, TA31076F, the initiation current consumption can be changed by using the I_{cont} terminal. The resistor R_{SL} is connected to GND terminal [pin 5 (5)] from I_{cont} terminal as shown in Fig.2.

Further, the initiation current consumption can be changed by changing the value of R_{SL} .

$$R_{SL} \geq 2k\Omega$$

(Refer to Fig.1)

3. Oscillation frequency

In TA31076S, TA31076F, two kinds of oscillation frequencies f_{H1} and f_{H2} of high frequency oscillating circuit are alternately oscillated and output through oscillation frequency f_L of low frequency oscillating circuit.

Oscillation frequencies f_L , f_{H1} and f_{H2} can be set by C_1 , C_2 , R_1 and R_2 of external circuit.

The standard of each oscillation frequency is as follows.

Set R_1 and R_2 at $140k\Omega$ or over.

- (1) $f_L \approx 1 / 1.25 \cdot R_1 \cdot C_1$
- (2) $f_{H1} \approx 1 / 1.36 \cdot R_2 \cdot C_2$
- (3) $f_{H2} \approx 1.29 \cdot f_{H1}$

4. Ring detect output

When the IC becomes oscillating start condition, about 5V voltage is output at the D_{OUT} terminal. It is pulled down about $200k\Omega$.
