DIPPED MICA CAPACITORS

DESIGN AND CONSTRUCTION

Dielectric

Semco dipped mica capacitors are fabricated from the finest India Ruby Muscovite Mica that is available. This particular form exhibits the best characteristics which may be obtained from mica and results in a capacitor with optimum high temperature characteristics and excellent stability.

Mica is a natural inorganic material, an aluminum silicate mineral, having toughness, elasticity, and adaptability to thin splitting. When these physical attributes are combined with the excellent electrical characteristics of mica, its value as a capacitor dielectric can be readily recognized.

Electrodes

Silvered mica construction permits intimate contact between the electrodes and the dielectric enabling uniform control of capacitance and a great increase in order of stability.

The electrodes are silver which is applied to the mica dielectric by a screening process, and then fired in an oxidizing atmosphere to obtain a permanent bond. This method provides a plate which will always remain in the same relative position with the dielectric.

The silver is applied in the form of a paste. The screening process, which positions the silvered pattern and determines the margins, is also controlled and is accurate to within 0.001".

Section

Depending upon capacitance value desired, a number of silvered mica films is stacked together to form a capacitor section.

Contact to the silver electrodes is made by means of either tin-lead foil strips, or pure silver foil strips, which are laid in so as to cover a portion of the silvered area. These foil contacts extend beyond the edge of the mica with each foil being extended alternately on the opposite sides of the silvered films. The joining of these foil extensions at each end, converts the series capacitors to one in which each silvered mica film is in parallel with the next. This joining is accomplished by folding the foil contacts over the top of the section.

The section is then compressed, and clinched tightly in the hot tinned lead and clamp assembly to assure positive contact. Once this has been accomplished, the entire assembly becomes known as an insert and is ready for dipping.

Coating

For protection, the inserts are encased with a number of coats of a mineral filled phenolic compound which is then vacuum impregnated with an epoxy resin. The result is a rugged coating which protects the capacitor against shock and vibration, and has outstanding resistance to humidity.

All DM5 capacitors are constructed with pure silver foil contacts so as to make positive connection to the small silver electrode patterns printed on the mica films, and so as to eliminate problems encountered during the soldering operation of small capacitors when lead-tin contact foils reach the melting point and flow, causing open or shorted units.

Because of its small size, the terminal pull test must be in the direction of the leads rather than perpendicular to the leads.

STYLE DM10

Military Styles: CMR04 (MIL - C - 39001) CM04 — CM09 (MIL - C - 5)

All DM10 capacitors are constructed with pure silver foil contacts.

Like the DM5, all DM10 capacitors are constructed with pure silver foil contacts. The benefits of using this foil are twofold. First of all, positive connection to the small silver electrode areas is ensured. Secondly, the pure silver contact foils do not reach the melting point and flow during the soldering operation, as is the case when lead-tin contact foils are used in small size capacitors.

TYPICAL TEMPERATURE COEFFICIENT RANGE FOR DM30 DIPPED MICA CAPACITORS

*NOTE: Where dimensions are not given for a particular capacitance value, use dimensions for next greater voltage rating.

Maximum dimension for 1CE capacitors are available on request.

ORDERING DATA

SEMCO Type Designation

PREFIX	DM20	E	D	101	K	O	1CRT
	STYLE	CHARACTERISTIC	VOLTAGE	CAPACITANCE	TOLERANCE	TEMPERATURE RANGE	DIPPED COATING

Prefix

This part of the type designation is normally left blank and is used when the following is desired:

“HR” — These letters designate a debugging or burn-in operation to which the capacitor has been subjected so as to improve its reliability, (see page 16)

“M2” — This letter-number combination designates special processing techniques applied to the capacitor so as to obtain optimum performance and reliability.

Style

The style is identified by two letters followed by two numbers: the combination of letters and numbers indicates the shape and dimensions of the capacitor.

Characteristic

The characteristic letter designates the performance requirements of the dipped mica capacitor with changing temperature. First, it specifies a rate of change of capacitance with temperature, which is commonly called temperature coefficient of capacitance and is given as a range in parts per million per degrees centigrade. Second, it specifies the deviation of capacitance from the original value after temperature cycling, which is known as capacitance drift and is given as a maximum change. The parameters are normally measured at 1 KHz or 1 MHz depending upon the nominal capacitance value.

LETTER DESIGNATION	TEMPERATURE COEFFICIENT	CAPACITANCE DRIFT
C	$\pm 200P/10^6/^{\circ}C$	$\pm (0.5\% + 0.1pF)$
D	$\pm 100P/10^6/^{\circ}C$	$\pm (0.3\% + 0.1pF)$
E	$20 \text{ to } +100P/10^6/^{\circ}C$	$\pm (0.1\% + 0.1pF)$
F	$0 \text{ to } +70P/10^6/^{\circ}C$	$\pm (0.05\% + 0.1pF)$

DC Voltage Rating

The voltage letter designates the voltage rating of the dipped mica capacitor. Semco dipped mica capacitors are available in voltage ratings from 50 through 2500 VDC. All the dipped mica capacitors listed will withstand an application of a DC potential equal to twice the DC working voltage for one to five seconds, without damaging, arcing or breaking down. The surge current should be limited to a maximum of five milliamperes.

LETTER DESIGNATION	VOLTAGE RATING	LETTER DESIGNATION	VOLTAGE RATING
A	100	K	2500
C	300	L	3000
D	500	M	4000
F	1000	N	5000
H	1500	Y	50
J	2000		

Capacitance

The nominal capacitance value is expressed in pF and is normally identified by a three-digit number. The first two digits represent significant figures and the last digit specifies the number of zeros to follow. In special cases where three significant figures are needed, the nominal capacitance in pF is identified by a four-digit number. In this case, the first three digits represent significant figures and the last specifies the number of zeros to follow. For capacitance values less than 10 pF the letter "R" will be employed. (Example, "1R0")

The capacitance values as listed in this catalog represent the nominal capacitance value at +25°C. Capacitance is measured at 1 MHz for nominal values of 1000 pF or less, and at 1 KHz for nominal values greater than 1000 pF.

Tolerance

The tolerance letter designates the tolerance in per cent of the nominal capacitance value at +25°C.

LETTER DESIGNATION	CAPACITANCE TOLERANCE*	LETTER DESIGNATION	CAPACITANCE TOLERANCE*
A	±1pF	H	±3%
B	±0.5pF	J	±5%
E	±1/2%	K	±10%
F	±1%	M	±20%
G	±2%		

*For capacitance values of 100 pF or less, the minimum standard available tolerance is ±0.5 pF.

Temperature Range

The temperature letter designates the guaranteed temperature range over which the dipped mica capacitor may be successfully operated.

LETTER DESIGNATION	TEMPERATURE RANGE
D	-55 to +125°C
P	-55 to +150°C

Dipped Coating

SEMCO DM capacitors are dipped in a mineral filled phenolic compound which is then vacuum impregnated with an epoxy resin to form the case material surrounding the capacitor. The result is a rugged casing that protects the capacitor section against

shock, vibration, humidity, and voltage. The dipped coating is completely solid, will not drip under any operating temperature, and will easily resist the high temperatures of soldering. The case will withstand a potential of 1000 VDC when more than one coat of phenolic is applied. In order to assure trouble free use of these parts in printed circuit application, the amount of resin on the leads is carefully controlled.

1CE: These capacitors actually have no phenolic coating, but are merely vacuum impregnated with an epoxy resin for mechanical strength; the epoxy impregnation offers no moisture or case insulation protection. These parts are ideally suited for use where extreme small size is required. It is recommended that 1CE units be used only where they will later be encapsulated or receive some other environmental protection.

1CRT: These single, thin phenolic dip and epoxy impregnated capacitors, which are guaranteed to meet 5 cycles of 16 hours at 40°C and 90% RH, followed by 8 hours at room conditions (for a total of 120 hours), are ideally suited for use where size must be as small as possible, and where moisture protection is needed, but where moisture is not a major problem.

1CRH: These single, heavy phenolic dip and epoxy impregnated capacitors, which are guaranteed to meet the 10 cycle moisture resistance test given in the MIL-C-5 specification, are ideally suited for use where a compromise has to be made with size and moisture protection.

4CR (standard dip): Our normal production dipped mica capacitors are manufactured with four coats of phenolic resin which are then vacuum impregnated with an epoxy resin. These units easily meet the requirements after the 10 cycle moisture resistance test given in the MIL-C-5 specification, and the 20 cycle moisture resistance test given in the MIL-C-39001 specification.

5CR: Where the ultimate is desired for moisture protection, dipped mica capacitors are also manufactured with 5 coats of phenolic resin before being vacuum impregnated with an epoxy resin.

ORDERING DATA

Case Insulation

Where the case insulation test voltage is 150 VDC or less, the full voltage is normally applied. However, where the case insulation voltage exceeds 150 VDC, the test voltage should be increased at the rate of 500 volts per second. Limits are given in the chart below:

MAXIMUM INSULATION BREAKDOWN

CASE STYLE	VDC TEST VOLTAGE	METHODS			
		PARALLEL PLATES	#9 BUCKSHOT	WIRE PROBE	WATER
1CE	0	NO	NO	NO	NO
1CRT	25	YES	NO	NO	NO
1CRH	100	YES	YES	NO	NO
4CR	1000	YES	YES	YES	YES
5CR	2000	YES	YES	YES	YES

Leads

Standard straight leads: All SEMCO dipped mica capacitors are normally supplied with straight radial wire leads. The dimension between the centers of the leads is measured at the point of emergence from the case.

Copper-clad: All SEMCO dipped mica capacitors are manufactured with copper-clad steel leads. The copper-clad leads are annealed and manufactured with steel wire #SAE 1010 or #SAE 1006, having a 30% minimum conductivity copper coating. The leads are finished with a solder coating (60% tin and 40% lead), having a minimum thickness of 0.0001".

Brass: Upon request, all of the SEMCO dipped mica capacitors can be manufactured with brass leads. These brass leads are annealed and have a composition of 70% copper and 30% zinc. The leads are finished with a solder coating (60% tin and 40% lead), having a minimum thickness of 0.0001".

Standard crimped leads: Crimped leads can be supplied, when specified, and are normally manufactured with copper-clad steel leads having the same composition and finish as previously indicated.

Special Leads

In addition to the leads previously described, we are able to supply Dumet wire leads having a gold plating of 50 microinches minimum, and 200 microinches maximum, over a nickel flash of 50 microinches minimum, and 100 microinches maximum. This material is ideally suited when welding methods are employed.

Marking

All SEMCO dipped mica capacitors are permanently marked with a special white ink which is extremely durable and will withstand all the environmental conditioning in the EIA and MIL specifications. These markings will also meet the permanency and durability requirements after the abrasion test, corrosion test and the solvents test of military specification MIL-M-13231, as well as other "Permanency of Markings" specifications.

In addition to the information described below, we are prepared to stamp the capacitor with the customer's part number, the SEMCO type designation, or any other special requirements that might be specified.

All units are normally stamped with the nominal capacitance value, capacitance tolerance in percent, and the SEMCO identification.

1CE: 1CE capacitor styles are **not** normally identified with any markings. However, where size permits it is possible to stamp some identification. In the very small 1CE styles, it is possible to supply the unit with a colored identification dot.

Temperature Coefficient

The typical temperature coefficient curves shown on other pages of this catalog have envelopes indicating the extreme temperature coefficient limits within which 90% of the dipped mica capacitors will fall. When special temperature coefficient limits are required, or when it is desired that the units be separated into temperature coefficient cells, we are prepared to perform a 100% measurement of the temperature coefficient and capacitance drift parameters.

High Temperature

Insert capacitors having no body coating, can be designed and supplied for operating temperatures in the area of 400°C. Where capacitors will be used in a special application, we are often able to design parts when we are aware of your special requirements.

Insulation Resistance

Since insulation resistance is a function of both capacitance and temperature, it of necessity is lower with higher capacitance values and higher operating temperatures. However, dipped mica capacitors having higher insulation resistance values than specified in the commercial and military specifications, are available. Following are curves of insulation resistance requirements which are normally employed for special production dipped mica capacitors.

M2DM Design

Units having the M2DM construction, are parts which incorporate all the special processing techniques which can be applied to dipped mica capacitors so as to obtain operational improvement in all areas. These high reliability capacitors normally have a failure rate ranging from 0.001% to 0.0001% per thousand hours at a 90% confidence level.

The M2DM dipped mica dielectric capacitors are manufactured with the best available grade of capacitor mica which is as free from visual imperfections as the best manufacturing conditions permit. The electrodes are silver and contact to them is made by means of silver foil strips. These silver foil contacts extend beyond the edge of the mica in order that they can be folded over and clinched in the lead clamp for preliminary mechanical contact. The lead clamp ears are then soldered to the silver foil for permanent electrical connection. The silvered mica capacitor insert is encased with a number of coats of phenolic; the phenolic coating is then vacuum impregnated with an epoxy resin.

The high reliability dipped mica capacitors are guaranteed to exhibit a capacitance change of not more than 0.5% or 0.5 pF (whichever is greater) after being subjected to such environmental testing as vibration, shock, acceleration, altitude, corrosion, temperature and immersion cycling, moisture resistance, and life test.

QUALITY AND RELIABILITY

Acceptable Quality Levels

TEST OR CONDITIONING	AQL'S FOR NORMAL PRODUCTION
Visual & Mechanical Major	0.4%
Electrical Dielectric Strength Insulation Resistance "Q" or Dissipation Factor Capacitance	0.25%
Environmental Insulation Resistance at Elevated Temperature	0.65%
Temperature Coefficient and Capacitance Drift	2.5%
Vibration	1.5%
Temperature and Immersion Cycling	2.5%
Terminal Strength Moisture Resistance	2.5%

Findings

Analysis of life test results has revealed the following comparisons, with all operating factors equal:

- Failure rate varies directly with capacitance value in a given case style. As the capacitance of the unit increases, the number of mica films required for construction increases. By far the principal cause of failure is puncture of mica film. As a result, the probability of failure goes up with the addition of mica films to the capacitive section.
- It follows that, for a given capacitance value, the larger case style will have greater reliability. The larger capacitors enable use of mica film with larger area capable of more capacitance per film. as a result, fewer films are required to obtain a given capacity value when a larger case style is employed. Fewer films result in less failures and greater reliability.
- Statistical analysis of life tests run at various degrees of voltage and temperature stress have made possible the establishment of the effects of variation of these stresses on failure rate. It has been found that expected life of a mica capacitor will decrease 50% with each 10°C rise in temperature. As for voltage, test results show that life expectancy varies inversely with the eighth power of voltage.

Debugging

The major portion of mica capacitor failures takes place very early in life of operation. Undetected defects in construction which are invisible and impossible to screen will usually appear after a brief

period of actual operation. These inherent weaknesses cannot be detected through severe screening unless stress level is high enough to damage otherwise good units. A time factor, therefore, becomes essential to detection of these flaws, hence, the debugging technique has been introduced.

Debugging is the process of subjecting components to a short term accelerated life test designed to eliminate early failures. After careful experimentation and analysis of past test results, a set of parameters has been established to effect safe and efficient detection of the borderline capacitors which produce early failures. The test is of sufficient stringency to destroy most of the potential failures while leaving good units undamaged, and is extended for a sufficient length of time to provide a maximum screening effect. The result is elimination of at least 80% of all units which would have otherwise failed under continuation of life test.

STANDARD DEBUGGING TEST CONDITIONS

RATED CONDITIONS		DEBUGGING TEST CONDITIONS		
TEMP.	VOLTAGE	TIME	VOLTAGE	TEMP.
125°C	≤ 1000 VDC	48 HRS.	2 X RATED	150°C
150°C	≤ 1000 VDC	72 HRS.	2 X RATED	150°C

Dissipation Factor

MIL-C-39001

DIPPED MICA CAPACITORS

IMPORTANT NOTE: MIL-C-5 capacitor styles CM04, CM05, CM06, CM07, CM09, CM10, CM11 and CM12 are no longer standard items for use in design after 21 December 1970. They are suitable for use in design contracts current to that date and to support existing military equipment. MIL-C-39001 styles are preferred for design, and regardless of their failure rate level designation, they can be substituted for the inactivated capacitors.

SEMCO dipped mica capacitors are fabricated from the finest India Ruby Muscovite Mica that is available. This particular form exhibits the best characteristics which may be obtained from mica and results in a capacitor with optimum high temperature characteristics and excellent stability.

Style

The style is identified by CMR and two numbers for CMR03, CMR04, CMR05, CMR06, CMR07 (see size charts).

Characteristics

C = Temperature Coefficient of ± 200 P/PM/°C
Capacitance drift of $\pm(5\% + 0.1 \text{ pF})$

E = Temperature Coefficient of $-20 + 100$ P/PM/°C
Capacitance drift of $\pm(0.1\% + 0.1 \text{ pF})$

F = Temperature Coefficient of 0 to $+70$ P/PM/°C
Capacitance drift of $\pm(0.05\% + 0.1 \text{ pF})$

Electrical Characteristics

- Operating Temperature -55°C to $+125^\circ\text{C}$
..... -55°C to $+150^\circ\text{C}$
- DC Rated Voltage 50, 100, 300, 500
as indicated on size charts
- Capacitance Range 1 pF thru 20,000 pF
- Capacitance Tolerance $\pm 5\text{pF}$, $\pm 1\%$, $\pm 2\%$, $\pm 5\%$
- Dielectric Withstanding Voltage 2 X Rated Voltage
for not less than 1 second
nor more than 5 seconds

Capacitance

The nominal capacitance value is expressed in pF and is identified by a three digit number. The first two digits represent significant figures and the last digit specifies the number of zeros to follow.

Capacitance Range

CMR03	1	through	,400 pF
CMR04	1	through	,390 pF
CMR05	1	through	,390 pF
CMR06	430	through	4,700 pF
CMR07	5100	through	20,000 pF

TOLERANCE J = 5% G = 2% F = 1% D = .5 pF

TEMPERATURE O = -55 to $+125^\circ\text{C}$
P = -55 to $+150^\circ\text{C}$

SEMCO Catalog Number

Marking

JAN and J marking. The United States Government has adopted, and is exercising legitimate control over, the certification marks "JAN" and "J" respectively, to indicate electrical equipment; namely resistors, capacitors, electron tubes and the like, procured by, or manufactured for use by, or for the Government in accordance with standard Government specifications. Accordingly, capacitors procured to, and meeting all of the requirements specified herein and in applicable specification sheets shall bear the certification mark "JAN," except that capacitors too small to bear the certification mark "JAN" shall bear the letter "J."

Capacitors furnished under contracts or orders which either permit or require deviation from the conditions or requirements specified herein and in applicable specification sheet, the manufacturer shall remove the "JAN" or the "J" from the sample tested and also from all capacitors represented by the sample. The United States Government has obtained Certificate of Registration No. 504,860 for the certification mark "JAN." An established reliability (ER) part manufactured in accordance with this specification may be marked and furnished as a non-ER part from MIL-C-5, if produced on the same assembly line, and provided it is subjected to and meets all the inspection requirements of the ER part.

Failure Rate

These capacitors have a failure rate level ranging from 1.0 percent per 1,000 hours to .01 percent per 1,000 hours. The failure rate level is established at a 90% confidence level. The failure rate is referred to operational life at full rated voltage at 125°C .

VOLTAGE RATING

D = 500 WV
C = 300 WV
A = 100 WV
Y = 50 WV

FAILURE RATE

M = 1.0% per 1000 hrs.
P = 1% per 1000 hrs.
R = .01% per 1000 hrs.

NOTE: All other electrical requirements are in full qualification to the established military reliability specification MIL-C-39001. Additional information available on request.

SCOPE

Semco M2HRCMS0 dipped mica capacitors are fabricated from the finest India Ruby Muscovite Mica that is available and is as free from visual imperfections as the best manufacturing conditions permit. The electrodes are silver and contact to them is made by means of silver foil strips. These silver foil contacts extend beyond the edge of the mica in order that they can be folded over and clinched in the lead clamp for preliminary mechanical contact. The lead clamp ears are then soldered to the silver foil for

permanent electrical connection. The silvered mica capacitor insert is encased with a number of coats of phenolic; the phenolic coating is then vacuum impregnated with an epoxy resin.

These capacitors are used in critical applications where the utmost in stability and dependability is required and where variations in capacitance with respect to temperature, voltage, frequency and life cannot be tolerated, such as in space, missile, and other high reliability applications.

METAL CLAD MICA CAPACITORS

DESIGN AND CONSTRUCTION

The SEMCO type **"MCM"** and **"MIN"** are fixed, metal clad, impregnated, mica or silvered mica capacitors designed with low inductance terminals for operation in the gigahertz range.

The metal clad mica capacitors are fabricated from India Ruby Muscovite Mica. This particular form exhibits the best characteristics which may be obtained from mica and results in a capacitor with optimum high temperature characteristics and excellent stability.

The low capacitance units are stacked with pre-gaged thicknesses of unsilvered mica films, then clinched in a metal case and a low inductance terminal.

The high capacitance units are stacked with pre-tested silvered mica films then clinched in a metal case and a low inductance terminal.

Metal clad mica capacitors are supplied with various terminal configurations. All terminals and cases are silver plated for positive contact between the electrodes and terminals.

The metal clad mica capacitors are impregnated with either high temperature wax or silicone depending on the customer specification requirements.

Teflon Dielectric is supplied for values 51 pF and below for **"MCM"** styles, and 10 pF and below for **"MIN"** styles.

Electrical Characteristics

1. Capacitance range – 1 thru 1000pF for **"MCM"**, 1 thru 350pF for **"MIN"**.
2. Capacitance tolerance – +1/2%, +1%, +2%, +5%, +10%, +20%. For capacitance values of 100 pF or less, the minimum standard available tolerance is +0.5pF.
3. Dielectric strength – Minimum 200% of rated voltage for 5 seconds.
4. Insulation resistance – 1000 megohms uF. Need not exceed 100000 megohms at 25C.
5. Min. Q at 1MHz – See attached drawing.

Mechanical Characteristics

1. The thickness dimension will vary depending on the capacitance value and voltage specified. The maximum thickness dimension is available upon request.
2. The capacitance value is permanently stamped on the back of the case.

Tape and Reel

Tape and Reel is available on selected styles.

Style

The style is identified by a three-letter symbol "MCM" or "MIN" followed by a two-digit number; the letters identify metal clad mica capacitors and the number identifies the shape and dimensions of the capacitor.

Terminal Configuration

This three-digit number identifies the terminal configuration required. The various constructions are shown in the detail drawings.

Characteristic

The characteristic letter designates the performance requirements of the metal clad mica capacitor with changing temperature. First, it specifies a rate of change of capacitance with temperature, which is commonly called temperature coefficient of capacitance and is given as a range in parts per million per degrees centigrade. Second, it specifies the deviation of capacitance from the original value after temperature cycling, which is known as capacitance drift and is given as a maximum change. The parameters are normally measured at 1KHz or 1MHz depending upon the nominal capacitance value.

LETTER DESIGNATION	TEMPERATURE COEFFICIENT	CAPACITANCE DRIFT
C	$\pm 200\text{P}/10^6/^\circ\text{C}$	$\pm (0.5\% + 0.1\text{pF})$
D	$\pm 100\text{P}/10^6/^\circ\text{C}$	$\pm (0.3\% + 0.1\text{pF})$
E	$20 \text{ to } \pm 100\text{P}/10^6/^\circ\text{C}$	$\pm (0.1\% + 0.1\text{pF})$
F	$0 \text{ to } \pm 70\text{P}/10^6/^\circ\text{C}$	$\pm (0.05\% + 0.1\text{pF})$

ORDERING DATA

DC Voltage Rating

The voltage letter designates the voltage rating of the metal clad mica capacitor. Standard SEMCO metal clad mica capacitors are available in voltage ratings from 50 to 500VDC. Higher voltage ratings available upon request. All the metal clad mica capacitors listed will withstand an application of a DC potential equal to a minimum of twice the DC working voltage for one to five seconds, without damaging, arcing, or breaking down. The surge current should be limited to a maximum of five milliamperes.

LETTER DESIGNATION	VOLTAGE RATING*
A	100
B	250
C	300
D	500
Y	50

* max voltage rating for "MIN" style 300V.

Capacitance

The nominal capacitance value is expressed in pF and is normally identified by a three-digit number. The first two digits represent significant figures and the last digit specifies the number of zeros to follow. In special cases where three significant figures are needed, the nominal capacitance in pF is identified by a four-digit number. In this case, the first three digits represent significant figures and the last specifies the number of zeros to follow. For capacitance values less than 10 pF the letter "R" will be employed. (Example: "1R0").

The capacitance values as listed in this catalog represent the nominal capacitance value at +25°C. Capacitance is measured at 1 MHz for nominal values of 1000 pF or less.

Tolerance

The tolerance letter designates the tolerance in percent of the nominal capacitance value at +25°C.

LETTER DESIGNATION	CAPACITANCE TOLERANCE*	LETTER DESIGNATION	CAPACITANCE TOLERANCE*
A	±1pF	H	±3%
D	±0.5pF	J	±5%
E	±1/2%	K	±10%
F	±1%	M	±20%
G	±2%		

*For capacitance values of 100 pF or less, the minimum standard available tolerance is ±0.5 pF.

Temperature Range

The temperature letter designates the guaranteed temperature range over which the metal clad mica capacitor may be successfully operated.

LETTER DESIGNATION	TEMPERATURE RANGE
O	-55 to +125°C
P	-55 to +150°C

MINIMUM Q VS CAPACITANCE AT 1 MHZ
