

HIGH-SPEED 2K x 8 FourPort™ STATIC RAM

IDT7052S/L

Features

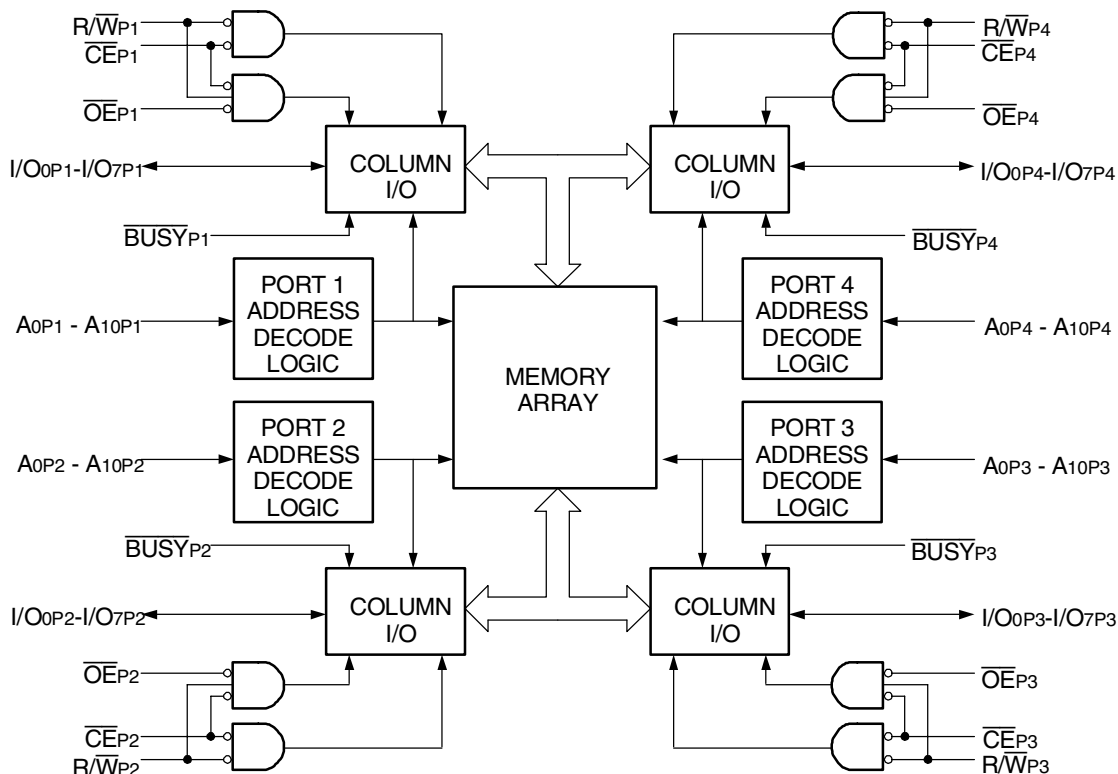

- ◆ **High-speed access**
 - Commercial: 20/25/35ns (max.)
 - Industrial: 25ns (max.)
 - Military: 25/35ns (max.)
- ◆ **Low-power operation**
 - IDT7052S
Active: 750mW (typ.)
Standby: 7.5mW (typ.)
 - IDT7052L
Active: 750mW (typ.)
Standby: 1.5mW (typ.)
- ◆ **True FourPort memory cells which allow simultaneous access of the same memory locations**
- ◆ **Fully asynchronous operation from each of the four ports: P1, P2, P3, P4**
- ◆ **Versatile control for write-inhibit: separate $\overline{\text{BUSY}}$ input to control write-inhibit for each of the four ports**

- ◆ **Battery backup operation—2V data retention**
- ◆ **TTL-compatible; single 5V ($\pm 10\%$) power supply**
- ◆ **Available in 120 pin and 132 pin Thin Quad Flatpacks and 108 pin PGA**
- ◆ **Military product compliant to MIL-PRF-38535 QML**
- ◆ **Industrial temperature range (-40°C to $+85^{\circ}\text{C}$) is available for selected speeds**
- ◆ **Green parts available, see ordering information**

Description

The IDT7052 is a high-speed 2K x 8 FourPort™ Static RAM designed to be used in systems where multiple access into a common RAM is required. This FourPort Static RAM offers increased system performance in multiprocessor systems that have a need to communicate in real time and also offers added benefit for high-speed systems in which multiple access is required in the same cycle.

Functional Block Diagram

2674 drw 01

JULY 2006

The IDT7052 is also designed to be used in systems where on-chip hardware port arbitration is not needed. This part lends itself to those systems which cannot tolerate wait states or are designed to be able to externally arbitrate or withstand contention when all ports simultaneously access the same FourPort RAM location.

The IDT7052 provides four independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. It is the user's responsibility to ensure data integrity when simultaneously accessing the same memory location from all ports. An automatic power down feature, controlled by \overline{CE} , permits the on-chip circuitry of each port to enter a very low power standby power mode.

Fabricated using IDT's CMOS high-performance technology, this FourPort SRAM typically operates on only 750mW of power. Low-power (L) versions offer battery backup data retention capability, with each port typically consuming 50 μ W from a 2V battery.

The IDT7052 is packaged in a ceramic 108-pin Pin Grid Array (PGA), 120-pin Thin Quad Flatpack (TQFP) and 132-pin Plastic Quad Flatpack (PQF). Military grade product is manufactured in compliance with the latest revision of MIL-PRF-38535 QML, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

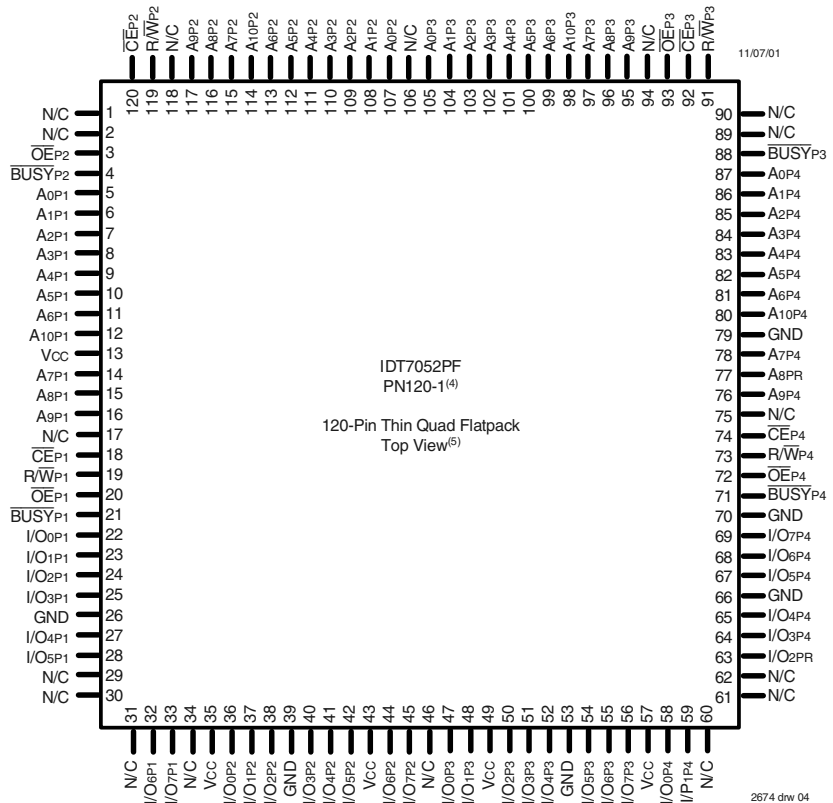

Pin Configurations^(1,2,3)

NOTES:

1. All Vcc pins must be connected to the power supply.
2. All GND pins must be connected to the ground supply.
3. Package body is approximately 1.21 in x 1.21 in x .16 in.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of the actual part-marking.

Pin Configurations^(1,2,3) (con't.)

NOTES:

1. All Vcc pins must be connected to the power supply.
2. All GND pins must be connected to the ground supply.
3. PQ132-1 package body is approximately .95 in x .95 in x .14 in.
PN120-1 package body is approximately 14mm x 14mm x 1.4mm.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of the actual part-marking
6. The side of the package containing pin1 may have a bevelled edge in place of the indicator dot..

Pin Configurations^(1,2)

Symbol	Pin Name
A0 P1 - A10 P1	Address Line s - Port 1
A0 P2 - A10 P2	Address Line s - Port 2

Vcc	Power

NOTES:

1. All Vcc pins must be connected to the power supply.
2. All GND pins must be connected to the ground supply

2674 tbl 01

Capacitance⁽¹⁾

(TA = +25°C, f = 1.0MHz) TQFP only

Symbol	Parameter	Conditions ⁽²⁾	Max	Unit
CIN	Input Capacitance	VIN = 0V	9	pF
COUT	Output Capacitance	VOUT = 0V	10	pF

2674 tbl 03

NOTES:

1. This parameter is determined by device characterization but is not production tested.
2. 3dV references the interpolated capacitance when the input and the output signals switch from 0V to 3V or from 3V to 0V.

Absolute Maximum Ratings⁽¹⁾

Symbol	Rating	Commercial & Industrial	Military	Unit
VTERM ⁽²⁾	Terminal Voltage with Respect to GND	-0.5 to +7.0	-0.5 to +7.0	V
TBIAS	Temperature Under Bias	-55 to +125	-65 to +135	°C
TSTG	Storage Temperature	-65 to +150	-65 to +150	°C
IOUT	DC Output Current	50	50	mA

2674 tbl 02

NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. VTERM must not exceed Vcc + 10% for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of VTERM ≥ Vcc + 10%.

Maximum Operating Temperature and Supply Voltage⁽¹⁾

Grade	Ambient Temperature	GND	Vcc
Military	-55°C to +125°C	0V	5.0V ± 10%
Commercial	0°C to +70°C	0V	5.0V ± 10%
Industrial	-40°C to +85°C	0V	5.0V ± 10%

2674 tbl 04

NOTES:

1. This is the parameter TA. This is the "instant on" case temperature.

Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max	Unit
Vcc	Supply Voltage	4.5	5.0	5.5	V
GND	Ground	0	0	0	V
VIH	Input High Voltage	2.2	—	6.0 ⁽²⁾	V
VIL	Input Low Voltage	-0.5 ⁽¹⁾	—	0.8	V

2674 tbl 05

NOTES:

1. VIL ≥ -1.5V for pulse width less than 10ns.
2. VTERM must not exceed Vcc + 10%.

2674 tbl 06

NOTES:

- 'X' in part number indicates power rating (S or L).
- V_{CC} = 5V, T_A = +25°C and are not production tested.
- f = 0 means no address or control lines change.
- At f = f_{MAX}, address and control lines (except Output Enable) are cycling at the maximum frequency read cycle of 1/trc, and using "AC Test Conditions" of input levels of GND to 3V.
- For the case of one port, divide the appropriate current above by four.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (V_{CC} = 5.0V ± 10%)

2674 tbl 10

NOTES:

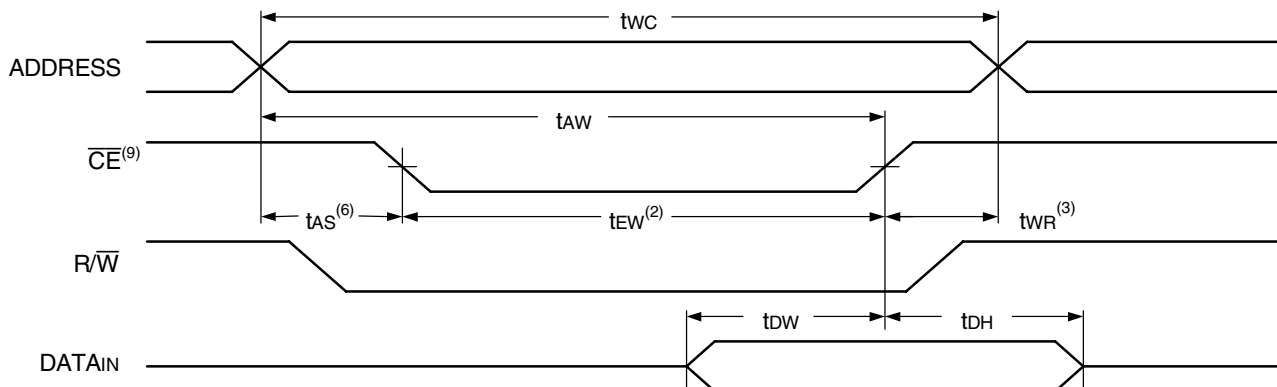

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization but is not production tested.
3. If $\overline{\text{OE}} = \text{V}_{\text{IL}}$ during a R/W controlled write cycle, the write pulse width must be the larger of t_{WP} or (t_{WZ} + t_{DW}) to allow the I/O drivers to turn off data to be placed on the bus for the required t_{DW}. If $\overline{\text{OE}} = \text{V}_{\text{IH}}$ during an R/W controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP}. Specified for $\overline{\text{OE}} = \text{V}_{\text{IH}}$ (refer to "Timing Waveform of Write Cycle", Note 8).
4. Port-to-port delay through RAM cells from writing port to reading port, refer to "Timing Waveform of Write with Port-to-Port Read".
5. To ensure that the write cycle is inhibited on port "A" during contention from Port "B". Port "A" may be any of the four ports and Port "B" is any other port.
6. To ensure that a write cycle is completed on port "A" after contention from Port "B". Port "A" may be any of the four ports and Port "B" is any other port.
7. 'X' in part number indicates power rating.

Timing Waveform of Write Cycle No. 1, R/W Controlled Timing^(5,8)

2674 drw 09

Timing Waveform of Write Cycle No. 2, CE Controlled Timing^(1, 5)

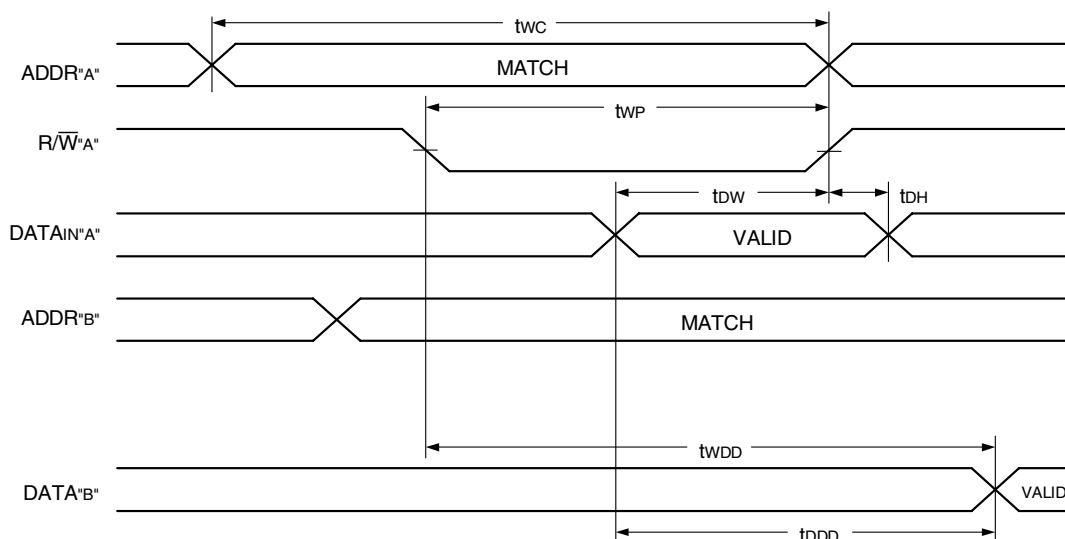

2674 drw 10

NOTES:

1. R/\overline{W} or $\overline{CE} = V_{IH}$ during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a $\overline{CE} = V_{IL}$ and a $R/\overline{W} = V_{IL}$.
3. t_{WR} is measured from the earlier of \overline{CE} or $R/\overline{W} = V_{IH}$ to the end of write cycle.
4. During this period, the I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CE} = V_{IL}$ transition occurs simultaneously with or after the $R/\overline{W} = V_{IL}$ transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal is asserted last, \overline{CE} or R/\overline{W} .
7. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed but is not production tested.
8. If $\overline{OE} = V_{IL}$ during a R/\overline{W} controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WZ} + t_{OW})$ to allow the I/O drivers to turn off data to be placed on the bus for the required t_{OW} . If $\overline{OE} = V_{IH}$ during an R/\overline{W} controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .

Timing Waveform of Write with Port-to-Port Read^(1,2,3)

2674 drw 11

NOTES:

1. Assume $\overline{\text{BUSY}}$ input = V_{IH} and $\overline{\text{CE}} = V_{IL}$ for the writing port.
2. $\overline{\text{OE}} = V_{IL}$ for the reading ports.
3. All timing is the same for left and right ports. Port "A" may be either of the four ports and Port "B" is any other port.

Timing Waveform of Write with **BUSY** Input

2674 drw 12

NOTES:

1. $\overline{\text{BUSY}}$ is asserted on Port "B" blocking $\overline{\text{R/W}}^{\text{B}}$ until $\overline{\text{BUSY}}^{\text{B}}$ goes HIGH.

Functional Description

The IDT7052 provides four ports with separate control, address, and I/O pins that permit independent access for reads or writes to any location in memory. These devices have an automatic power down feature controlled by $\overline{\text{CE}}$. The $\overline{\text{CE}}$ controls on-chip power down circuitry that permits the respective port to go into standby mode when not selected ($\overline{\text{CE}} = V_{IH}$). When a port is enabled, access to the entire memory array is permitted. Each port has its own Output Enable control ($\overline{\text{OE}}$). In the read mode, the port's $\overline{\text{OE}}$ turns on the output drivers when set LOW. READ/ WRITE conditions are illustrated in the table below.

Truth Table I – Read/Write Control⁽³⁾

Any Port ⁽¹⁾				Function
R/W	$\overline{\text{CE}}$	$\overline{\text{OE}}$	Do-7	
X	H	X	Z	Port Deselected: Power-Down
X	H	X	Z	$\overline{\text{CE}}_1 = \overline{\text{CE}}_2 = \overline{\text{CE}}_3 = \overline{\text{CE}}_4 = V_{IH}$ Power Down Mode ISB or ISB1
L	L	X	DATAin	Data on port written into memory ⁽²⁾
H	L	L	DATAout	Data in memory output on port
X	X	H	Z	Outputs Disabled

2674 tbl 11

NOTES:

1. "H" = V_{IH} , "L" = V_{IL} , "X" = Don't Care, "Z" = High Impedance
2. If $\overline{\text{BUSY}} = V_{IL}$, write is blocked.
3. For valid write operation, no more than one port can write to the same address location at the same time.
