Am27C010

1 Megabit (131,072 x 8-Bit) CMOS EPROM

DISTINCTIVE CHARACTERISTICS

- Easy upgrade from 28-pin JEDEC EPROMs
- Fast access time
 - 100 ns
- Low power consumption
 - 100 μ A maximum standby current
- Programming voltage: 12.5 V
- Single + 5-V power supply
- Compact 32-pin DIP package requires no hardware change for upgrades to 8 megabits
- JEDEC-approved pinout
- $\pm 10\%$ power supply tolerance available
- One-Time Programmable (OTP) Flashrite™ programming
- Latch-up protected to 100 mA from -1 V to $V_{cc} + 1$ V

GENERAL DESCRIPTION

The Am27C010 is a 1 megabit ultraviolet erasable programmable read-only memory. It is organized as 128K words by 8 bits per word, operates from a single + 5-V supply, has a static standby mode, and features fast single address location programming. Products are available in windowed ceramic DIP and LCC packages as well as plastic one time programmable (OTP) packages.

Typically, any byte can be accessed in less than 100 ns, allowing operation with high-performance microprocessors without any WAIT states. The Am27C010 offers separate Output Enable ($\overline{OE}$) and Chip Enable ($\overline{CE}$) controls, thus eliminating bus contention in a multiple bus

microprocessor system.

AMD's CMOS process technology provides high speed, low power, and high noise immunity. Typical power consumption is only 100 mW in active mode, and 250 μ W in standby mode.

All signals are TTL levels, including programming signals. Bit locations may be programmed singly, in blocks, or at random. The Am27C010 supports AMD's interactive programming algorithm (0.5 ms pulses) resulting in typical programming times of less than two minutes.

ORDERING INFORMATION

Standard Information

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

- Device Number
- Speed Option
- Package Type
- Temperature Range
- Optional Processing

Valid Combinations	
AM27C010-100	DC, DCB
AM27C010-105	
AM27C010-120	DC, DCB, DI, DIB, LC, LI
AM27C010-125	
AM27C010-155	
AM27C010-175	
AM27C010-205	
AM27C010-255	
AM27C010-305	DC, DCB, DE, DEB, DI, DIB, LC, LCB, LI, LIB, LE, LEB
AM27C010-170	
AM27C010-200	
AM27C010-250	
AM27C010-300	

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, to check on newly released combinations, and to obtain additional data on AMD's standard military grade products.

T-46-13-29

ORDERING INFORMATION (Cont'd.) OTP Products (Preliminary)

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
- b. Speed Option
- c. Package Type
- d. Temperature Range
- e. Optional Processing

Valid Combinations	
AM27C010-170	PC, JC
AM27C010-175	
AM27C010-200	
AM27C010-205	
AM27C010-250	
AM27C010-255	
AM27C010-300	
AM27C010-305	

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, to check on newly released combinations, and to obtain additional data on AMD's standard military grade products.

*Package in Development; consult NVD Product Marketing for Information.

T-46-13-29

ORDERING INFORMATION (Cont'd.)

APL Products

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. APL (Approved Products List) products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
- b. Speed Option
- c. Device Class
- d. Package Type
- e. Lead Finish

Valid Combinations	
AM27C010-170	/BXA, /BUA
AM27C010-200	
AM27C010-250	
AM27C010-300	

For other Surface Mount Package options, contact NVD Military Marketing.

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations or to check for newly released valid combinations.

Group A Tests

Group A tests consist of Subgroups 1, 2, 3, 7, 8, 9, 10, 11.

FUNCTIONAL DESCRIPTION

Erasing the Am27C010

In order to clear all locations of their programmed contents, it is necessary to expose the Am27C010 to an ultraviolet light source. A dosage of 15 W seconds/cm² is required to completely erase an Am27C010. This dosage can be obtained by exposure to an ultraviolet lamp—wavelength of 2537 Angstroms (Å)—with intensity of 12,000 μW/cm² for 15 to 20 minutes. The Am27C010 should be directly under and about one inch from the source and all filters should be removed from the UV light source prior to erasure.

It is important to note that the Am27C010, and similar devices, will erase with light sources having wavelengths shorter than 4000 Å. Although erasure times will be much longer than with UV sources at 2537 Å, nevertheless the exposure to fluorescent light and sunlight will eventually erase the Am27C010 and exposure to them should be prevented to realize maximum system reliability. If used in such an environment, the package window should be covered by an opaque label or substance.

Programming the Am27C010

Upon delivery, or after each erasure, the Am27C010 has all 1,048,576 bits in the "ONE", or HIGH state. "ZEROS" are loaded into the Am27C010 through the procedure of programming.

The programming mode is entered when 12.5 ± 0.5 V is applied to the V_{pp} pin, $\overline{CE}$ and PGM is at V_{IL} , and $\overline{OE}$ is at V_{IH} .

For programming, the data to be programmed is applied 8 bits in parallel to the data output pins.

The flowchart Figure 1 shows AMD's interactive algorithm. Interactive algorithm reduces programming time by using short programming pulses and giving each address only as many pulses as is necessary in order to reliably program the data. After each pulse is applied to a given address, the data in that address is verified. If the data does not verify, additional pulses are given until it verifies or the maximum is reached. This process is repeated while sequencing through each address of the Am27C010. This part of the algorithm is done at $V_{cc} = 6.0$ V to assure that each EPROM bit is programmed to a sufficiently high threshold voltage. After the interactive programming is completed, an overprogram pulse is given to each memory location; this ensures that all bits have sufficient margin. After the final address is completed, the entire EPROM memory is verified at $V_{cc} = 5$ V $\pm 5\%$.

Flashrite

The OTP EPROM Flashrite programming algorithm (shown in Figure 2) reduces programming time by using initial 100 μs pulses followed by a byte verification to determine whether the byte has been successfully programmed. If the data does not verify, an additional pulse is applied for a maximum of 25 pulses. This process is repeated while sequencing through each address of the OTP EPROM.

The Flashrite programming algorithm programs and verifies at $V_{cc} = 6.25$ V and $V_{pp} = 12.75$ V. After the final address is completed, all bytes are compared to the original data with $V_{cc} = V_{pp} = 5.25$ V.

Program Inhibit

Programming of multiple Am27C010 in parallel with different data is also easily accomplished. Except for $\overline{CE}$, all like inputs of the parallel Am27C010 may be common. A TTL low-level program pulse applied to an Am27C010 $\overline{CE}$ input with $V_{pp} = 12.5 \pm 0.5$ V, PGM is LOW, and $\overline{OE}$ HIGH will program that Am27C010. A high-level $\overline{CE}$ input inhibits the other Am27C010 from being programmed.

Program Verify

A verify should be performed on the programmed bits to determine that they were correctly programmed. The verify should be performed with $\overline{OE}$ and $\overline{CE}$ at V_{IL} , PGM at V_{IH} , and V_{pp} between 12.0 V to 13.0 V.

Auto Select Mode

The auto select mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional in the $25^\circ\text{C} \pm 5^\circ\text{C}$ ambient temperature range that is required when programming the Am27C010.

To activate this mode, the programming equipment must force 12.0 ± 0.5 V on address line A_0 of the Am27C010. Two identifier bytes may then be sequenced from the device outputs by toggling address line A_0 from V_{IL} to V_{IH} . All other address lines must be held at V_{IL} during auto select mode.

Byte 0 ($A_0 = V_{IL}$) represents the manufacturer code, and byte 1 ($A_0 = V_{IH}$), the device identifier code. For the Am27C010, these two identifier bytes are given in the Mode Select table. All identifiers for manufacturer and device codes will possess odd parity, with the MSB (DQ₇) defined as the parity bit.

Read Mode

The Am27C010 has two control functions, both of which must be logically satisfied in order to obtain data at the outputs. Chip Enable ($\overline{CE}$) is the power control and should be used for device selection. Output Enable ($\overline{OE}$) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that addresses are stable, address access time (t_{ACC}) is equal to the delay from $\overline{CE}$ to output (t_{CE}). Data is available at the outputs t_{OE} after the falling edge of $\overline{OE}$, assuming that $\overline{CE}$ has been LOW and addresses have been stable for at least $t_{ACC} - t_{OE}$.

Standby Mode

The Am27C010 has a CMOS standby mode which reduces the maximum V_{cc} current to 100 μA. It is placed in CMOS standby when $\overline{CE}$ is at $V_{cc} \pm 0.3$ V. The Am27C010 also has a TTL-standby mode which reduces the maximum V_{cc} current to 1.0 mA. It is placed in TTL-standby when $\overline{CE}$ is at V_{IH} . When in standby mode, the outputs are in a high-impedance state, independent of the $\overline{OE}$ input.

Output OR-Tieing

To accommodate multiple memory connections, a two-line control function is provided to allow for:

1. Low memory power dissipation, and
2. Assurance that output bus contention will not occur.

T-46-13-29

It is recommended that $\overline{CE}$ be decoded and used as the primary device-selecting function, while $\overline{OE}$ be made a common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low-power standby mode and that the output pins are only active when data is desired from a particular memory device.

System Applications

During the switch between active and standby conditions, transient current peaks are produced on the rising and falling

edges of Chip Enable. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. At a minimum, a 0.1- μ F ceramic capacitor (high frequency, low inherent inductance) should be used on each device between V_{CC} and GND to minimize transient effects. In addition, to overcome the voltage drop caused by the inductive effects of the printed circuit board traces on EPROM arrays, a 4.7- μ F bulk electrolytic capacitor should be used between V_{CC} and GND for each eight devices. The location of the capacitor should be close to where the power supply is connected to the array.

MODE SELECT TABLE

Mode	Pins	$\overline{CE}$	$\overline{OE}$	PGM	A_0	A_1	V_{PP}	Outputs
Read		V_{IL}	V_{IL}	X	X	X	X	D_{OUT}
Output Disable		V_{IL}	V_{IH}	X	X	X	X	Hi-Z
Standby (TTL)		V_{IH}	X	X	X	X	X	Hi-Z
Standby (CMOS)		$V_{CC} \pm 0.3 V$	X	X	X	X	X	Hi-Z
Program		V_{IL}	V_{IH}	V_{IL}	X	X	V_{PP}	D_{IN}
Program Verify		V_{IL}	V_{IL}	V_{IH}	X	X	V_{PP}	D_{OUT}
Program Inhibit		V_{IH}	X	X	X	X	V_{PP}	Hi-Z
Auto Select (Note 3)	Manufacturer Code	V_{IL}	V_{IL}	X	V_{IL}	V_H	X	O1H
	Device Code	V_{IL}	V_{IL}	X	V_{IH}	V_H	X	OE H

Notes: 1. $V_H = 12.0 V \pm 0.5 V$

2. X = Either V_{IH} or V_{IL}

3. $A_1 - A_8 = A_{10} - A_{15} = V_{IL}$

4. See DC Programming Characteristics for V_{PP} voltage during programming.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature	
OTP products	-65 to 125°C
All other products	-65 to 150°C
Ambient Temperature	
with Power Applied	-55 to +125°C
Voltage with Respect to Ground:	
All pins except A_0 , V_{PP} , and	
V_{CC}	-0.6 to $V_{CC} + 0.5$ V
A_0 and V_{CC}	-0.6 to 13.5
V_{CC}	-0.6 to 7.0 V

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure of the device to absolute maximum rating conditions for extended periods may affect device reliability.

- Notes: 1. Minimum DC voltage on input or I/O is -0.5 V. During transitions, the inputs may undershoot GND to -2.0 V for periods of up to 20 ns. Maximum DC voltage on input and I/O is $V_{CC} + 0.5$ V which may overshoot to $V_{CC} + 2.0$ V for periods up to 20 ns.
2. For A_0 and V_{PP} the minimum DC input is -0.5 V. During transitions, A_0 and V_{PP} may undershoot GND to -2.0 V for periods of up to 20 ns. A_0 and V_{PP} must not exceed 13.5 V for any period of time.

OPERATING RANGES

Commercial (C) Devices	
Case Temperature (T_C)	0 to +70°C
Industrial (I) Devices	
Case Temperature (T_C)	-40 to +85°C
Extended Commercial (E) Devices	
Case Temperature (T_C)	-55 to +125°C
Military (M) Devices	
Case Temperature (T_C)	-55 to +125°C
Supply Read Voltages:	
V_{CC} for Am27C010-XX5	+4.75 to +5.25 V
V_{CC} for Am27C010-XX0	+4.50 to +5.50 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

DC CHARACTERISTICS over operating range unless otherwise specified. (Notes 1, 4, 5, & 8)
(for APL Products, Group A, Subgroups 1, 2, 3, 7, and 8 are tested unless otherwise noted)

- Notes:
1. V_{CC} must be applied simultaneously or before V_{PP} , and removed simultaneously or after V_{PP} .
 2. Typical values are for nominal supply voltages.
 3. This parameter is only sampled, not 100% tested.
 4. **Caution:** the Am27C010 must not be removed from (or inserted into) a socket when V_{CC} or V_{PP} is applied.
 5. I_{CC1} is tested with $\overline{OE} = V_{IH}$ to simulate open outputs.
 6. Maximum active power usage is the sum of I_{CC} and I_{PP} .
 7. $T_A = +25^\circ\text{C}$, $f = 1 \text{ MHz}$.
 8. Minimum DC Input Voltage is -0.5 V. During transitions, the inputs undershoot to -2.0 V for periods less than 20 ns. Maximum DC Voltage on output pins is $V_{CC} + 0.5 \text{ V}$ which may overshoot to $V_{CC} + 2.0 \text{ V}$ for periods less than 20 ns.
 9. For Am27C010-305 $I_{CC1} = 50 \text{ mA}$, I_{CC2} (TTL) = 5 mA, I_{CC2} (CMOS) = 1 mA, and $I_{PP1} = 1 \text{ mA}$.

t_{ELEH1}	t_{PW}	PGM Initial Program Pulse Width			
		Flashrite	95	105	μs
t_{ELEH2}	t_{OPW}	PGM Initial Program Pulse Width			
		Interactive	0.45	0.55	ms
t_{ELEH2}	t_{OPW}	PGM Overprogram Pulse Width (Interactive)	0.95	1.05	ms
t_{VCS}	t_{VCS}	V_{CC} Setup Time	2		μs
t_{ELPL}	t_{CES}	$\overline{CE}$ Setup Time	2		μs
t_{GLOV}	t_{OE}	Data Valid from $\overline{OE}$		150	ns

- Notes: 1. V_{CC} must be applied simultaneously or before V_{PP} , and removed simultaneously or after V_{PP} .
 2. When programming the Am27C010, a 0.1- μF capacitor is required across V_{PP} and ground to suppress spurious voltage transients which may damage the device.
 3. Programming characteristics are sampled but not 100% tested at worst-case conditions.

INTERACTIVE and FLASHRITE PROGRAMMING ALGORITHM WAVEFORM (Notes 1 and 2)

T-46-13-29

- Notes:**
1. The input timing reference level is 0.8 V for a V_{IL} and 2 V for a V_{IH} .
 2. t_{OE} and t_{DFP} are characteristics of the device but must be accommodated by the programmer.
