Features

- Wide frequency range:
0.2-12 GHz
- High input power sensitivity:
On-chip pre- and post-amps
 - 15 to +10 dBm (1-8 GHz)
 - 10 to +8 dBm (8-10 GHz)
 - 5 to +2 dBm (10-12 GHz)
- P_{out} : 0 dBm (0.5 V_{p-p})
- Low phase noise:
-153 dBc/Hz @ 100 kHz offset
- (+) or (-) Single supply bias operation
- Wide bias supply range:
4.5 to 6.5 volt operating range
- Differential I/O with on-chip
50 Ω matching

Description

The Keysight Technologies, Inc. HMMC-3128 is a packaged GaAs HBT MMIC pre-scaler which offers dc to 12 GHz frequency translation for use in communications and EW systems incorporating high-frequency PLL oscillator circuits and signal-path down conversion applications. The prescaler provides a large input power sensitivity window and low phase noise.

Absolute maximum ratings¹

1. For sine-wave input signal. Prescaler will operate down to D.C. for square-wave input signal. Minimum divide frequency limited by input slew-rate.
2. Prescaler may exhibit this output signal under bias in the absence of an RF input signal. This condition may be eliminated by use of the Input dc offset technique described on page 4.
3. Fundamental of output square wave's Fourier Series.
4. Square wave amplitude calculated from P_{out} .

Applications

The HMMC-3128 is designed for use in high frequency communications, microwave instrumentation, and EW radar systems where low phase-noise PLL control circuitry or broad-band frequency translation is required.

Operation

The device is designed to operate when driven with either a single-ended or differential sinusoidal input signal over a 200 MHz to 12 GHz bandwidth. Below 200 MHz the prescaler input is “slew-rate” limited, requiring fast rising and falling edge speeds to properly divide. The device will operate at frequencies down to dc when driven with a square-wave.

Due to the presence of an off-chip RF-bypass capacitor inside the package (connected to the V_{CC} contact on the device), and the unique design of the device itself, the component may be biased from either a single positive or single negative supply bias. The backside of the package is not dc connected to any dc bias point on the device.

For positive supply operation, V_{CC} pins are nominally biased at any voltage in the +4.5 to +6.5 volt range with pin 8 (V_{EE}) grounded. For negative bias operation V_{CC} pins are typically grounded and a negative voltage between -4.5 to -6.5 volts is applied to pin 8 (V_{EE}).

ac-Coupling and dc-Blocking

All RF ports are dc connected on-chip to the V_{CC} contact through on-chip $50\ \Omega$ resistors. Under any bias conditions where V_{CC} is not dc grounded the RF ports should be ac coupled via series capacitors mounted on the PC-board at each RF port. Only under bias conditions where V_{CC} is dc grounded (as is typical for negative bias supply operation) may the RF ports be direct coupled to adjacent circuitry or in some cases, such as level shifting to subsequent stages. In the latter case the package heat sink may be “floated” and bias applied as the difference between V_{CC} and V_{EE} .

Figure 1. Simplified schematic diagram

Input dc Offset

If an RF signal with sufficient signal to noise ratio is present at the RF input lead, the prescaler will operate and provide a divided output equal the input frequency divided by the divide modulus. Under certain “ideal” conditions where the input is well matched at the right input frequency, the component may “self-oscillate”, especially under small signal input powers or with only noise present at the input. This “self-oscillation” will produce an undesired output signal also known as a false trigger. To prevent false triggers or self-oscillation conditions, apply a 20 to 100 mV dc offset voltage between the RF_{in} and RF_{in} ports. This prevents noise or spurious low level signals from triggering the divider.

Adding a 10 k Ω resistor between the unused RF input to a contact point at the V_{EE} potential will result in an offset of ≈ 25 mV between the RF inputs. Note however, that the input sensitivity will be reduced slightly due to the presence of this offset.

Assembly Notes

Independent of the bias applied to the package, the backside of the package should always be connected to both a good RF ground plane and a good thermal heat sinking region on the PC board to optimize performance. For single-ended output operation the unused RF output lead should be terminated into 50 Ω to a contact point at the VCC potential or to RF ground through a dc blocking capacitor.

A minimum RF and thermal PC board contact area equal to or greater than 2.67×1.65 mm ($0.105'' \times 0.065''$) with eight 0.020" diameter plated-wall thermal vias is recommended.

MMIC ESD precautions, handling considerations, die attach and bonding methods are critical factors in successful GaAs MMIC performance and reliability.
