

DESCRIPTION

This family is a 4M bit dynamic RAM organized 1,048,576 x 4-bit configuration with Fast Page mode CMOS DRAMs. Fast Page mode offers high speed of random access memory within the same row. The circuit and process design allow this device to achieve high performance and low power dissipation. Optional features are access time(50, 60 or 70ns) package type(SOJ or TSOP-II) and power consumption (Normal or Low power). Hyundai's advanced circuit design and process technology allow this device to achieve high bandwidth, low power consumption and high reliability.

FEATURES

- Fast Page Mode operation
- Read-modify-write Capability
- TTL compatible inputs and outputs
- /CAS-before-/RAS, /RAS-only, Hidden and Self refresh capability
- Max. Active power dissipation
- JEDEC standard pinout
- 20/26-pin SOJ (300mil)
- 20/26-pin TSOP-II(300mil)
- Single power supply of 5V $\pm$ 10%
- Early Write or output enable controlled write
- Fast access time and cycle time

Note

1. ICC1, ICC3, ICC4, ICC6 and ICC7 depend on output loading and cycle rates(tRC and tPC).
2. Specified values are obtained with output unloaded.
3. ICC is specified as an average current. In ICC1, ICC3, ICC6, address can be changed only once while /RAS=VIL. In ICC4, address can be changed maximum once while /CAS=VIH within one cycle time tPC.
4. Only tRAS(max) = 1μs is applied to refresh of battery backup but tRAS(max) = 10μs is to applied to normal functional operation.
5. ICC5(max.), ICC7 are applied to L-part only.

NOTE

1. An initial pause of 200 μ s is required after power-up followed by 8 /RAS only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 CBR refresh cycles instead of 8 /RAS-only refresh cycles are required.
2. If /RAS=Vss during power-up, the HY514400A could begin an active cycle. This condition results in higher current than necessary current which is demanded from the power supply during power-up. It is recommended that /RAS and /CAS track with Vcc during power-up or be held at a valid VIH in order to minimize the power-up current.
3. VIH(min.) and VIL(max.) are reference levels for measuring timing of input signals. Transition times are measured between VIH(min.) and VIL(max.), and are assumed to be 5ns for all inputs.
4. Measured at VOH=2.0V and VOL=0.8V with a load equivalent to 2TTL loads and 100pF.
5. tOFF(max.) and tOEZ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
6. Either tRCH or tRRH must be satisfied for a read cycle.
7. tCEZ and tOEZ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
8. twCS, trWD, tcWD, tAWD and tCPWD are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If twCS $\geq$ twCS(min.), the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle. If trWD $\geq$ trWD(min.), tcWD $\geq$ tcWD(min.), tAWD $\geq$ tAWD(min.), and tCPWD $\geq$ tCPWD(min.), the cycle is a read-modify-write cycle and data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
9. Operation within the tRCD(max.) limit ensures that tRAC(max.) can be met. tRCD(max.) is specified as a reference point only. If tRCD is greater than the specified tRCD(max.) limit, then access time is controlled by tCAC.
10. Operation within the tRAD(max.) limit ensures that tRAC(max.) can be met. tRAD(max.) is specified as a reference point only. If tRAD is greater than the specified tRAD(max.) limit, then access time is controlled by tAA.
11. tREF(max.)=128ms is applied to L-parts only.
12. A burst of 1024 CBR refresh cycles must be executed within 16ms (128ms for L-part) after exiting self refresh.
13. When CAS goes low at the same time, 4bits data are written into the device.
14. These parameters are determined by the earlier falling edge of /CAS.
15. These parameters are determined by the later rising edge of /CAS.
16. tCWL must be satisfied by /CAS for 4bits access cycle.
17. tCP and tCPT are measured when /CAS and is high state.
