

## FEATURES

- 3.3V and 5V power supplies required
- Also, supports LVPECL-to-PECL translation
- 500ps propagation delays
- Fully differential design
- ESD protection of 2000V
- Available in 28-pin PLCC package

## BLOCK DIAGRAM

## FUNCTION TABLE

| Function       | V <sub>cc</sub> | V <sub>cco</sub> | V <sub>cc_VBB</sub> |
|----------------|-----------------|------------------|---------------------|
| PECL-to-LVPECL | 5.0V            | 3.3V             | 5.0V                |
| LVPECL-to-PECL | 5.0V            | 5.0V             | 3.3V                |

## PIN NAMES

| Pin                 | Function                                   |

| V <sub>cc</sub>     | V <sub>cc</sub> for Internal Circuitry     |

## DESCRIPTION

The SY100E417 is a quint LVPECL-to-PECL translator. It can also be used as a quint PECL-to-LVPECL translator. The device receives standard PECL signals and translates them to differential LVPECL output signals (or vice versa).

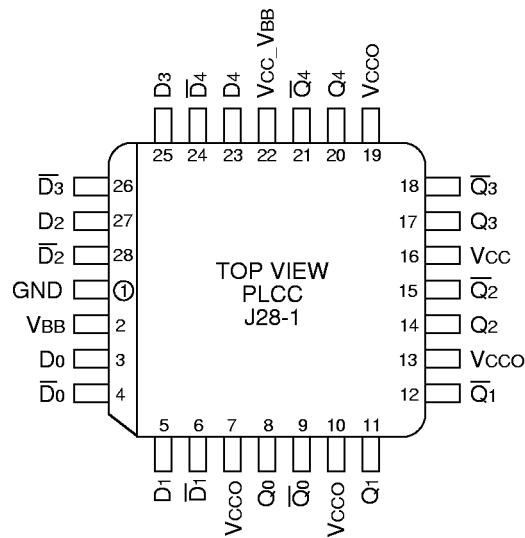

A V<sub>BB</sub> output is provided for interfacing single ended PECL signals at the inputs. If a single ended PECL input is to be used, the V<sub>BB</sub> output should be connected to the  $\bar{D}_n$  input and the active signal will drive the D<sub>n</sub> input. When used, the V<sub>BB</sub> should be bypassed to ground via a 0.01 $\mu$ F capacitor. The V<sub>BB</sub> is designed to act as a switching reference for the SY100E417 under single ended input conditions. As a result, the pin can only source/sink 0.5mA of current.

To accomplish the PECL-to-LVPECL level translation, the SY100E417 requires three power rails. The V<sub>cc</sub> and V<sub>cc\_VBB</sub> supply is to be connected to the standard PECL supply, the LVCC supply is to be connected to the V<sub>cco</sub> supply, and GND is connected to the system ground plane. Both the V<sub>cc</sub> and V<sub>cco</sub> should be bypassed to ground with a 0.01 $\mu$ F capacitor.

To accomplish the LVPECL-to-PECL level translation, the SY100E417 requires three power rails as well. The V<sub>cc</sub> supply is connected to the V<sub>cc</sub> and V<sub>cco</sub> pins, LVCC supply is connected to the V<sub>cc\_VBB</sub> pin and GND is connected to the system ground plane. V<sub>cc\_VBB</sub> is used to provide a proper V<sub>BB</sub> output level if a single ended input is used. If inputs are differential signals, LVCC is still required and must be connected to V<sub>cc\_VBB</sub> to maintain proper functionality.

Under open input conditions, the  $\bar{D}_n$  input will be biased at a V<sub>cc</sub>/2 voltage level and the D<sub>n</sub> input will be pulled to ground. This condition will force the "Q<sub>n</sub>" output low, ensuring stability.

## PIN CONFIGURATION

## PECL INPUT DC ELECTRICAL CHARACTERISTICS

V<sub>CC\_VBB</sub> = V<sub>CC</sub> = +4.5V to +5.5V; V<sub>CCO</sub> = +3.0V to +3.8V

### NOTES:

- Power supply requirements applies as indicated in the DC electrical characteristics tables.
- Skew is measured between outputs under identical transitions.
- Duty cycle skew is the difference between a TPLH and TPHL propagation delay through a device Common Mode Range.
- Minimum input swing for which AC parameters are guaranteed. The device has a DC gain of ~40.
- The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V<sub>PP</sub> min. and 1V.

## PRODUCT ORDERING CODE

| Ordering Code | Package Type | Operating Range | Ordering Code | Package Type | Operating Range |
|---------------|--------------|-----------------|---------------|--------------|-----------------|
| SY100E417JC   | J28-1        | Commercial      | SY100E417JI   | J28-1        | Industrial      |
| SY100E417JCTR | J28-1        | Commercial      | SY100E417JITR | J28-1        | Industrial      |

## 28 LEAD PLASTIC LEADED CHIP CARRIER (J28-1)
