2EZ6.8~2EZ51

SILICON ZENER DIODES

| VOLTAGE	6.8 to 51 Volt	POWER	2 Watt

DO-15

Unit : inch(mm)

FEATURES

- Low inductance
- Plastic package has Underwriters Laboratory Flammability Classification 94V-O
- High temperature soldering : 260°C /10 seconds at terminals
- Lead free in compliance with EU RoHS 2011/65/EU directive

MECHANICAL DATA

- Case: JEDEC DO-15, Molded plastic over passivated junction
- Terminals: Solder plated, solderable per MIL-STD-750, Method 2026
- Polarity: Color band denotes cathode end
- Standard packing: 52mm tape
- Weight: 0.014 ounce, 0.0397 gram

1 Cathode   2 Anode
MAXIMUM RATINGS AND ELECTRICAL CHARACTERISTICS

Ratings at 25°C ambient temperature unless otherwise specified.

Parameter	Symbol	Value	Unit
Max Steady State Power Dissipation @$T_L \leq 80^O$C (Note A) Derate above T_A=25°C	P_D	2	Watts
Peak Forward Surge Current 8.3ms single half sine-wave soperimposed on rated load	I_{FSM}	15	Amps
Thermal resistance Junction to Ambient Junction to Lead	$R_{\Theta JA}$ $R_{\Theta JL}$	60 32	^{O}C/W
Operating Junction and Storage Temperature Range	T_J , T_{STG}	-55 to + 150	^{O}C

NOTE:

A.Mounted on infinite heat sink with L=2mm

B.Measured on 8.3ms, and single half sine-wave or equivalent square wave, duty cycle=4 pulses per minute maximum

FIGURE 2. MAXIMUM SURGE POWER

NOTE BELOW 0.1 SECOND, THERMAL RESPONSE CURVE IS APPLICABLE TO ANY LEAD LENGTH(L).

DUTY CYCLE, D = t1 t2

SINGLE PULSE $\Delta T_{JL} = \theta_{JL}(t)P_{PK}$
REPETITIVE PULSES $\Delta T_{JL} = \theta_{JL}(t,D)P_{PK}$

FIGURE 3. TYPICAL THERMAL RESPONSEL,

APPLICATION NOTE:
   Since the actual voltage available from a given zener diode is temperature dependent, it is necessary to determine junction temperature under any set of operating conditions in order to calculate its value. The following procedure is recommended:
   Lead Temperature, T_L, should be determined from:

$$T_L = \theta_{LA} P_D + T_A$$

θL_A is the lead-to-ambient thermal resistance (^{O}C/W) and Pd is the power dissipation. The value for θL_A will vary and depends on the device mounting method. θL_A is generally 30-40 ^{O}C/W for the various clips and tie points in common use and for printed circuit board wiring.
   The temperature of the lead can also be measured using a thermocouple placed on the lead as close as possible to the tie point.
   The thermal mass connected to the tie point is normally large enough so that it will not significantly respond to heat surges generated in the diode as a result of pulsed operation once steady-state conditions are achieved. Using the measured value of TL, the junction temperature may be determined by:

$$T_J = T_L + \Delta T_{JL}$$

ΔT_{JL} is the increase in junction temperature above the lead temperature and may be found from Figure 3 for a train of power pulses.

$$\Delta T_{JL} = \theta L P_D$$

   For worst-case design, using expected limits of I_z, limits of P_D and the extremes of $T_J(\Delta T_J)$ may be estimated. Changes in voltage, V_z, can then be found from:

$$\Delta V = \theta V_Z \Delta T_J$$

θV_Z, the zener voltage temperature coefficient, is found from Figures 5 and 6.
Under high power-pulse operation, the zener voltage will vary with time and may also be affected significantly by the zener resistance. For best regulation, keep current excursions as low as possible.
   Data of Figure 3 should not be used to compute surge capa-bility. Surge limitations are given in Figure 2. They are lower than would be expected by considering only junction temperature, as current crowding effects cause temperatures to be extremely high in small spots resulting in device degradation should the limits of Figure 2 be exceeded.
