NOTES :

1. Conditions outside the limits listed under “ABSOLUTE MAXIMUM RATINGS” may cause permanent damage to the device.
2. All voltages are referenced to V_{SS} , V_{SSQ} .
3. Peak to peak AC noise on V_{REF} may not exceed $\pm 2\%$ $V_{REF(DC)}$.
4. $V_{OH}=1.95V$, $V_{OL}=0.35V$
5. $V_{OH}=1.9V$, $V_{OL}=0.4V$
6. The values of $I_{OH(DC)}$ is based on $V_{DDQ}=2.3V$ and $V_{TT}=1.19V$.
The values of $I_{OL(DC)}$ is based on $V_{DDQ}=2.3V$ and $V_{TT}=1.11V$.
7. These parameters depend on the cycle rate and these values are measured at a cycle rate with the minimum values of t_{CK} and t_{RC} .
8. V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF} .
9. These parameters depend on the output loading. Specified values are obtained with the output open.
10. Transition times are measured between $V_{IH\ min(AC)}$ and $V_{IL\ max(AC)}$. Transition (rise and fall) of input signals have a fixed slope.
11. If the result of nominal calculation with regard to t_{CK} contains more than one decimal place, the result is rounded up to the nearest decimal place.
(i.e., $t_{DQSS}=0.75 \times t_{CK}$, $t_{CK}=7.5ns$, $0.75 \times 7.5ns=5.625ns$ is rounded up to 5.6ns.)
12. V_X is the differential clock cross point voltage where input timing measurement is referenced.
13. V_{ID} is magnitude of the difference between CK input level and \overline{CK} input level.
14. V_{ISO} means $\{V_{ICK}(CK)+V_{ICK}(\overline{CK})\}/2$.
15. Refer to the figure below.

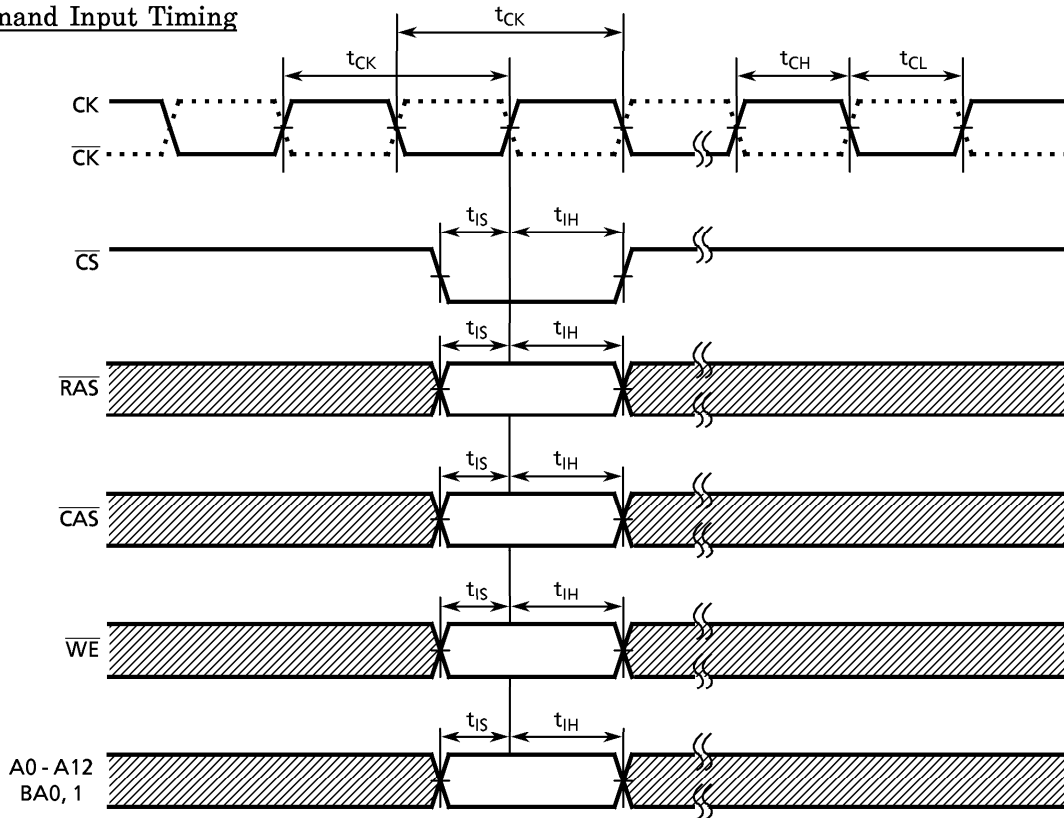

16. t_{AC} and t_{DQCK} depend on the clock jitter. These timing are measured at stable clock.

Power Up Sequence

1. Apply power and attempt to CKE at a low state ($\leq 0.2V$).
(all other inputs may be undefined)
 - (1) Apply V_{DD} before or at the same time as V_{DDQ} .
 - (2) Apply V_{DDQ} before or at the same time as V_{TT} and V_{REF} .
 - (3) \overline{RESET} is set to high.
2. Start Clock and maintain stable condition for $200\mu s$ (min).
3. After stable power and clock, apply NOP and take CKE high.
4. Issue EMRS - enable DLL and establish Output Driver Type.
5. Issue MRS - reset DLL and set device to idle with bit A8.
(an additional 200cycles(min) of clock are required for DLL Lock)
6. Issue precharge command for all banks of the device.
7. Issue two or more Auto Refresh commands.
8. Issue MRS - Initialize device operation.
(If device operation mode is set at sequence 5, sequence 8 can be skipped.)
 - (EMRS : Extended Mode Register Set
 - MRS : Mode Register Set
