Seiko Epson does not assume any liability of any kind arising out of any inaccuracies contained in this material or due to its application or use in any product or circuit and, further, there is no representation that this material is applicable to products requiring high level reliability, such as, medical products. Moreover, no license to any intellectual property rights is granted by implication or otherwise, and there is no representation or warranty that anything made in accordance with this material will be free from any patent or copyright infringement of a third party. This material or portions thereof may contain technology or the subject relating to strategic products under the control of the Foreign Exchange and Foreign Trade Control Law of Japan and may require an export licence from the Ministry of International Trade and Industry or other approval from another government agency.

Note the following precautions when using semiconductor devices.

[Precautions for light]

Due to the solar battery principle, the characteristics of the semiconductor devices generally change when the devices are irradiated. This IC, therefore, may malfunction when exposed to light.

Since this IC is not completely lightproof, follow the precautions below when using a substrate or product on which it is mounted.

- (1) Design and mount the substrate or product so as to block out any light from reaching the IC during actual use.
- (2) For the inspection process, design the environments so as to block out any light from reaching the IC.
- (3) When blocking out light, take all surfaces of the IC chip into account.

■ LCD controller-drivers for small-sized displays

Built-in character generators together with segment and common drivers simplify the task of displaying microprocessor messages on small LCDs.

Part number	Supply voltage range (V)	LCD voltage range (V)	Duty	Segment	Common	Display RAM (characters)	Microprocessor interface	Extension display output	Package	Comment

OVERVIEW

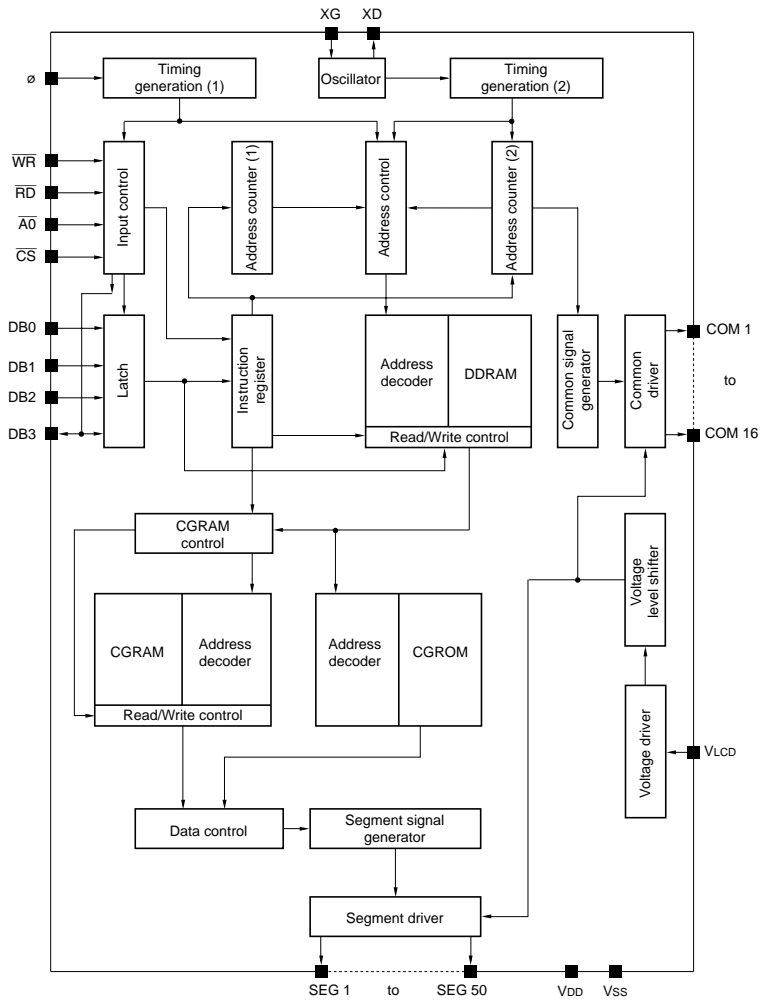

The SED1200 is a Liquid Crystal Display (LCD) character display controller-driver, capable of directly driving displays as large as 2 lines of 10 5×8 pixel characters, with a minimum of external components.

The SED1200 has an internal character generator (CG) consisting of 160 JIS ASCII characters in ROM and four user definable characters in RAM. The internal CG, a versatile set of cursor and display control commands, mean that the system CPU is only responsible for the display data and commands, and not for the LCD display itself.

FEATURES

- Internal display RAM to hold 20 8-bit character codes.
- Internal character generator
 - CGROM: 160 JIS ASCII characters.
 - CGRAM: 4 user programmable 5×8 pixel characters
 - Font: 5×7 pixel characters plus the underline cursor.
 - JIS character set using SED1200F0A/SED1200D0A
 - ASCII character set using SED1200F0B/SED1200D0B
- Internal LCD driver circuitry
 - 50 segment driver lines
 - 16 common driver lines
 - Total size: Two lines of 10 characters each (maximum). One line of 20 characters (LCD panel dependent)
- CPU interface
 - 4-bit CPU data bus
 - 13 display control commands
- Low external component count
 - Built in RC oscillator (using one external feedback resistor)
 - Built in LCD driver voltage-divider network.
- Implemented using low power CMOS technology
 - TTL compatible CPU interface
- Power supply
 - Logic: 2.5 V to 5.5 V
 - LCD: 3.5 V to 5.5 V
- 80 pin QFP package SED1200F and chip (SED1200D)

PIN DESCRIPTION

CPU Interface

- CS** Active low chip select input.
- RD** Active low read enable input.
- WR** Active low write strobe.
- A0** Selects between instruction and display data access.
A0 = H: Display data
A0 = L: Instruction
- D0–D2** Active high CPU data inputs.
- D3** Active high CPU data input/output.
- Φ Clock input for command execution.

Oscillator

- OSC1, OSC2** Terminals for the oscillator external feedback resistor, Rf. If an externally generated clock is used, it is connected to OSC1; OSC2 is left open.

Power Supply

- VDD** Logic power supply
- VLCD** LCD power supply
- VSS** System ground (0 V).

LCD Interface

- COM1–COM16** LCD common driver outputs.
- SEG1–SEG50** LCD segment driver outputs.

COMMAND DESCRIPTION

Command Summary

TABLE 2. SED1200 Command Summary

COMMAND NAME	CS	WR	RD	A0	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
SET CURSOR DIRECTION	0	0	1	0	0	0	0	0	0	1	0	D/I	D0 = 1 ... Decrement D0 = 0 ... Increment
CURSOR ADDRESS -1/+1	0	0	1	0	0	0	0	0	0	1	1	-1/+1	D0 = 1 ... Cursor address -1 D0 = 0 ... Cursor address +1
CURSOR FONT SELECT	0	0	1	0	0	0	0	0	1	0	0	A/U	D0 = 1 ... All dots blinking D0 = 0 ... Underline
CURSOR BLINK ON/OFF	0	0	1	0	0	0	0	0	1	0	1	ON/OFF	D0 = 1 ... ON D0 = 0 ... OFF
DISPLAY ON/OFF	0	0	1	0	0	0	0	0	1	1	0	ON/OFF	D0 = 1 ... ON D0 = 0 ... OFF
CURSOR ON/OFF	0	0	1	0	0	0	0	0	1	1	1	ON/OFF	D0 = 1 ... ON D0 = 0 ... OFF
SYSTEM RESET	0	0	1	0	0	0	0	1	0	0	0	0	Data RAM & CGRAM are not affected
LINE SELECT	0	0	1	0	0	0	0	1	0	0	1	2/1	D0 = 1 ... 2 line display (1/16 duty) D0 = 0 ... 1 line display (1/8 duty)
SET CGRAM ADDRESS	0	0	1	0	0	0	1	0	(LOWER ADDRESS)			Upper address fixed at 0H	
SET CGRAM DATA	0	0	1	0	0	1	0	(CGRAM DATA)					
SET CURSOR ADDRESS	0	0	1	0	1	2nd/1st (N DIGIT-1)						D6 = 1 ... 2nd line N digit address D6 = 0 ... 1st line N digit address	
SET CHARACTER CODE	0	0	1	1	(CHARACTER CODE)								
BUSY FLAG CHECK	0	1	0	0	BF	*	*	*	BF	*	*	*	High impedance

Write Commands

SET CURSOR DIRECTION

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	0	D

Sets the way in which the cursor address register changes as character data is written to the SED1200 by the CPU, and hence the direction of cursor movement.

D = 0: Address register increment direction
 D = 1: Address register decrement direction

CURSOR ADDRESS -1/+1

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	1	D

Adds one to, or subtracts one from, the current contents of the cursor address register, and hence moves the cursor.

D = 0: ADDRESS = ADDRESS + 1
 D = 1: ADDRESS = ADDRESS - 1

CURSOR FONT SELECT

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	0	D

D = 0: Underline cursor
 D = 1: All dots blinking

CURSOR BLINK ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	1	D

Controls flashing of the underline cursor.
 D = 0: Flashing stopped
 D = 1: Cursor flashing

DISPLAY ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	0	D

D = 0: Display Blanked
 D = 1: Display on
 Note: This command does not affect the contents of the display data RAM.

CURSOR ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	1	D

Controls the display of the cursor.
 D = 0: Cursor off.
 D = 1: Cursor on.

SYSTEM RESET

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	0	0

Initializes the SED1200 to the following defaults.

1. CURSOR DIRECTION: Increment
2. CURSOR FONT: Underline
3. CURSOR BLINK: Off
4. DISPLAY: Off
5. CURSOR: Off
6. LINE SELECT: One line display
7. CURSOR ADDRESS: Address 0 (Line 1, character 0)

Note: SYSTEM RESET does not affect the contents of the display data RAM, or the CGRAM.

LINE SELECT

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	1	D

Selects the number of displayed lines, and hence the LCD drive duty cycle.

D = 0: 1 line display (1/8 duty cycle)
 D = 1: 2 line display (1/16 duty cycle)

Note: The number of lines which can be displayed depends on the LCD panel used.

SET CURSOR ADDRESS

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
1	L	P5	P4	P3	P2	P1	P0

Presets the contents of the cursor address register, and hence the position of the cursor.

L = 0: Line 1 select
 L = 1: Line 2 select
 P5–P0: Position of character in selected line.

SET CHARACTER CODE**A0 = 1**

D7	D6	D5	D4	D3	D2	D1	D0
C7	C6	C5	C4	C3	C2	C1	C0

Writes the character code given by C7–C0 into the character data RAM at the location pointed to by the contents of the cursor address register. The contents of the cursor address register are then modified as specified by the last SET CURSOR DIRECTION instruction.

SET CGRAM ADDRESS**A0 = 0**

D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	0	*	*	A1	A0

Presets the contents of the CGRAM address register to the position of one of the four user definable characters. The address is specified by A1 and A0.

SET CGRAM DATA

Loads the bit pattern D4–D0 into the CGRAM location specified by the current contents of the CGRAM address register. The contents of the CGRAM Address Register are incremented following each write of a SET CGRAM DATA instruction by the CPU.

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	D4	D3	D2	D1	D0

See section 4.3, Loading CGRAM.

SPECIFICATIONS**Absolute Maximum Ratings**

Parameter	Symbol	Ratings	Unit
Supply voltage (1)	V _{DD}	–0.3 to +7.0	V
Supply voltage (2)	V _{LCD}	V _{DD} –7.0 to V _{DD} +0.3	V
Input voltage	V _{IN}	–0.3 to V _{DD} +0.3	V
Output voltage	V _{OUT}	–0.3 to V _{DD} +0.3	V
Operating temperature	T _{opr}	–10 to +70	°C
Storage temperature	T _{stg}	–40 to +125	°C
Soldering temperature and time	T _{sol}	260, 10	°C, s

Read Commands**BUSY FLAG CHECK**

Reading yields the status of the SED1200F.

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
BF	*	*	*	BF	*	*	*

BF = 0: SED1200 READY

BF = 1: SED1200 BUSY

Bits D2–D0 are tristate during reads of the Busy Flag.

OPERATION

Data Input/Output

Because the command codes are 8-bits wide and the SED1200's data bus is only 4-bits wide, the command codes must be split into two nibbles (4-bits), which are written separately.

Nibble	High-order				Low-order			
Data Bus Bit	D3	D2	D1	D0	D3	D2	D1	D0
Command Bit	D7	D6	D5	D4	D3	D2	D1	D0

The high-order nibble is written first, and is latched internally by the SED1200. When the low-order nibble is written, the eight bits of data are shifted into either the

character registers or the command register, depending on the level of A0 during the low-nibble write cycle. When the busy flag is read, only one read cycle is required.

New commands must not be written to the SED1200 if the device is executing one currently, so the busy flag should be checked before commands are written. It is not necessary to check the busy flag between writes of the upper and lower nibbles of commands. If the busy flag is not going to be checked between writes of individual commands then the MPU must wait long enough to allow for command execution to complete. The maximum time taken by the SED1200 to execute a command is $16/\Phi$, where Φ is the system clock frequency.

System Initialization

Figure 1 is a flow chart of a possible SED1200 initialization sequence. Note that busy flag checks, and busy/wait loops have been omitted for the sake of brevity.

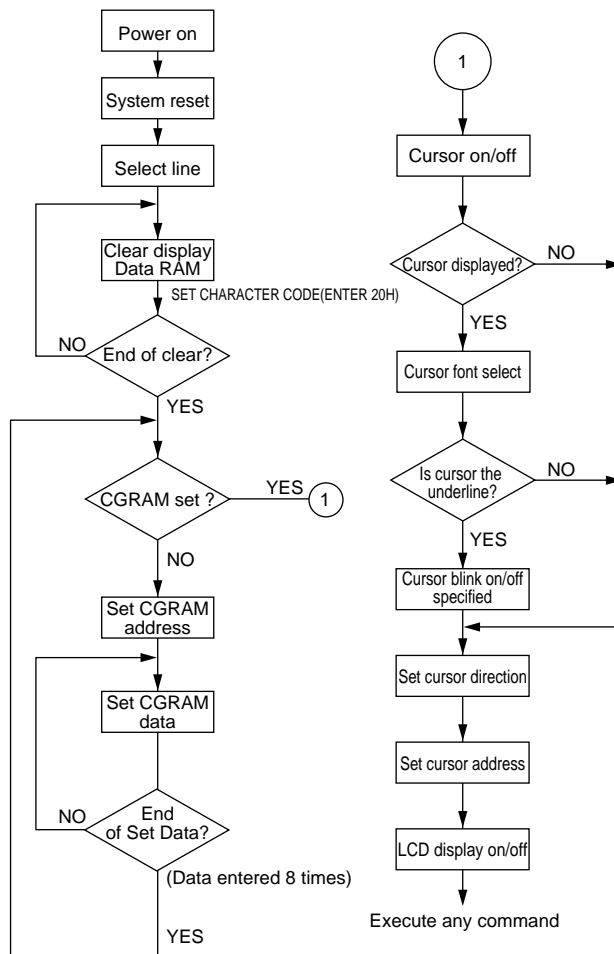

Figure 1. Initialization Flow Chart

Loading CGRAM

The character generator RAM is loaded with a character bit pattern using a combination of one SET CGRAM ADDRESS command and eight SET CGRAM DATA commands. For example, to load the character shown in figure 2 into the area of CGRAM corresponding to character code 01H, the sequence shown in table 3 is used.

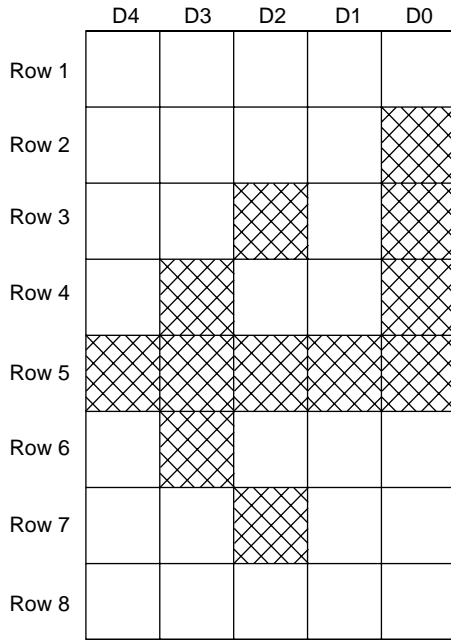

Figure 2. User Defined Character

TABLE 3. Loading User Defined Character

Step	A0	WR	Data	Action
1	0	0	21H	Set address of CGRAM 01
2	0	0	40H	Data for Row 1
3	0	0	41H	Data for Row 2
4	0	0	45H	Data for Row 3
5	0	0	49H	Data for Row 4
6	0	0	5FH	Data for Row 5
7	0	0	48H	Data for Row 6
8	0	0	44H	Data for Row 7
9	0	0	40H	Data for Row 8

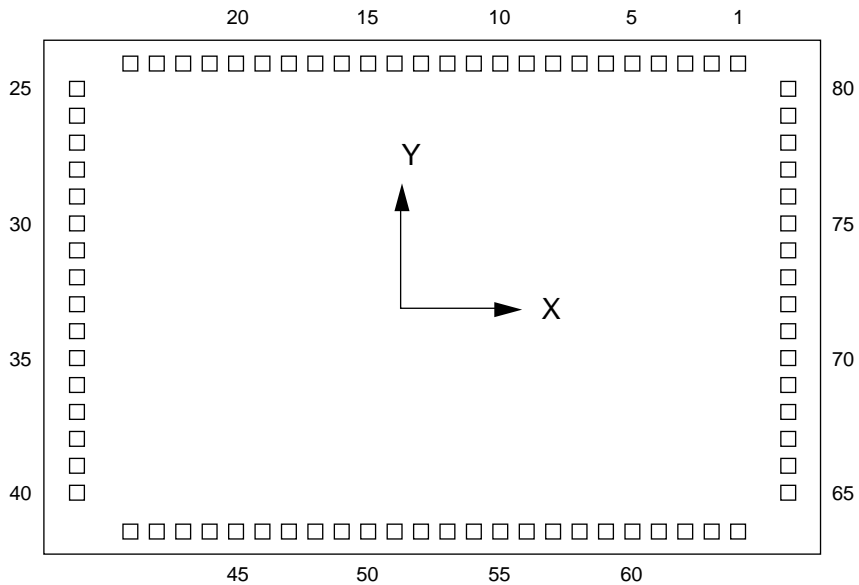

- Notes:
1. These steps do not include busy flag checks.
 2. Row 8 maybe used by the underline cursor.

APPLICATION NOTES

Display Oscillator

The SED1200 has an internal oscillator to generate the timing signals required for the LCD display.

If the internal oscillator is used, connect the feedback resistor R_f as shown in figure 3. The feedback resistor leads must be kept as short as possible to reduce stray capacitance and the possibility of crosstalk between the oscillator and adjoining signals.

Figure 3. Using the Internal Oscillator

If an external clock is used, connect it to OSC1, as shown in figure 4.

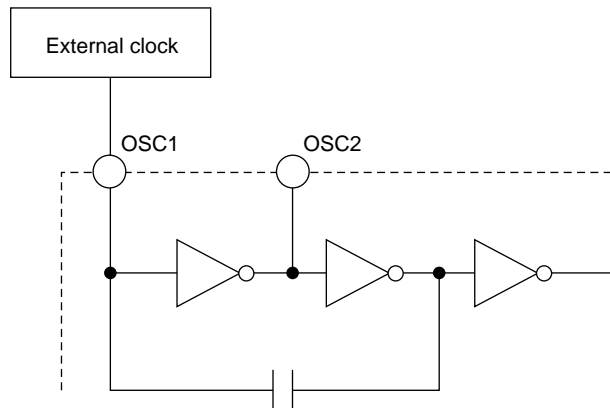

Figure 4. Using an External Clock

The relationship between the oscillator frequency and the LCD drive frame frequency is

$$f_{FR} = f_{OSC}/1600$$

For example if $f_{OSC} = 100 \text{ kHz}$, $f_{FR} = 62.5 \text{ Hz}$

Command Clock (Φ)

When the system MPU issues a command to the SED1200, the timing for the execution of the command is derived from Φ , the command clock. This would normally be the system MPU clock.

The maximum execution time for a command is $16/\Phi$. For example if $\Phi=1$ MHz, the maximum execution time for a command is $16 \mu\text{s}$.

LCD Drive Waveforms

The SED1200 has an internal low source-impedance voltage-driver network, of the form shown in figure 5. The switches S_{wa} are closed to switch the segment data.

OVERVIEW

The SED1210F is a Liquid Crystal Display (LCD) character display controller/driver, capable of directly driving displays of up to 16 characters. If an external expansion driver is used, displays of up to 40 characters can be generated.

The SED1210F has an internal character generator (CG) consisting of 160 JIS ASCII characters in ROM and four user definable characters in RAM. The internal CG, combined with a versatile set of cursor and display control commands, means that the system CPU is only responsible for the display data and commands, and not for the LCD display itself.

FEATURES

- Internal display RAM to hold 40 8-bit character codes.
- Internal character generator
 - CGROM: 160 JIS ASCII characters.
 - CGRAM: 4 user programmable 5×8 pixel characters
 - Font: 5×7 pixel characters plus the underline cursor, of 5×8 pixel characters alone.
 - JIS character set using SED1210F0A
 - ASCII character set using SED1210F0B
- Internal LCD driver circuitry
 - 40 segment driver outputs
 - 16 common driver outputs
 - Total size: 2 lines of 20 characters each (maximum). One line of 40 characters (using an SED1181F for external expansion)
- CPU interface
 - 8-bit CPU data bus
 - 13 display control commands
- Low external component count
 - Built in RC oscillator (using one external feedback resistor)
 - Built in LCD driver voltage-divider network.
- Implemented using low power CMOS technology
 - TTL compatible CPU interface
- Power supply
 - Logic: 2.5 V to 5.5 V
 - LCD: 3.5 V to 5.5 V
- 80-pin QFP package (plastic)

PIN DESCRIPTION

CPU Interface

- CS** Active low chip select input.
- RD** Active low read enable input.
- WR** Active low write strobe.
- A0** Selects between instruction and display data access.
A0 = H: Display data
A0 = L: Instruction
- DB0–DB6** Active high CPU data inputs.
- DB7** Active high CPU data input/output.
- Φ Clock input for command execution.

LCD Interface

- COM1–COM16** LCD command driver outputs.
- SEG1–SEG40** LCD segment driver outputs.
- SO** Serial segment data output
- LP** Latch output to segment driver
- SHCL** Shift clock output to segment
- FR** Frame output to segment driver

Oscillator

- OSC1, OSC2** Terminals for the oscillator external feedback resistor, R_f. If an externally generated clock is used, it is connected to OSC1; OSC2 is left open.

Power Supply

- VDD** Logic power supply input
- VLCD** LCD power supply input
- VSS** System ground (0 V) input
- VL2, VL3** LCD driver voltage outputs

Write Commands

SET CURSOR DIRECTION

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	0	D

Sets the way in which the cursor address register changes as character data is written to the SED1210F by the CPU, and hence the direction of cursor movement.

D = 0: Address register increment direction

D = 1: Address register decrement direction

CURSOR ADDRESS -1/+1

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	1	D

Adds one to, or subtracts one from, the current contents of the cursor address register, and hence moves the cursor.

D = 0: ADDRESS = ADDRESS + 1

D = 1: ADDRESS = ADDRESS - 1

CURSOR FONT SELECT

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	0	D

D = 0: Underline cursor

D = 1: All dots blinking

CURSOR BLINK ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	1	D

Controls flashing of the underline cursor.

D = 0: Blinking stopped

D = 1: Cursor blinking

DISPLAY ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	0	D

D = 0: Display off

D = 1: Display on

Note: This command does not affect the contents of the display data RAM.

CURSOR ON/OFF

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	1	D

Controls the display of the cursor.

D = 0: Cursor off.

D = 1: Cursor on.

SYSTEM RESET

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	0	0

Initializes the SED1210F to the following defaults.

CURSOR DIRECTION: Increment

CURSOR FONT: Underline

CURSOR BLINK: Off

DISPLAY: Off

CURSOR: Off

LINE SELECT: One line display

CURSOR ADDRESS: Address 0 (Line 1, character 0)

Note: SYSTEM RESET does not affect the contents of the display data RAM, or the CGRAM.

LINE SELECT

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	1	D

Selects the number of displayed lines, and hence the LCD drive duty cycle.

D = 0: 1 line display (1/8 duty cycle)

D = 1: 2 line display (1/16 duty cycle)

Note: The number of lines which can be displayed depends on the LCD panel used.

SET CURSOR ADDRESS

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
1	L	P5	P4	P3	P2	P1	P0

Presets the contents of the cursor address register, and hence the position of the cursor.

L = 0: Line 1 select

L = 1: Line 2 select

P5–P0: Position of character in selected line.

SET CHARACTER CODE

A0 = 1

D7	D6	D5	D4	D3	D2	D1	D0
C7	C6	C5	C4	C3	C2	C1	C0

Writes the character code given by C7–C0 into the character data RAM at the location pointed to by the cursor address register. The contents of the cursor address register are then modified as specified by the last SET CURSOR DIRECTION instruction.

SET CGRAM ADDRESS

$\overline{WR} = 0, A0 = 0$

D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	0	*	*	A1	A0

Presets the contents of the CGRAM address register to the position of one of the four user definable characters. The address is specified by A1 and A0.

SET CGRAM DATA

Loads the bit pattern D4–D0 into the CGRAM location specified by the current contents of the CGRAM address register. The contents of the CGRAM address register are incremented following each write of a SET CGRAM DATA instruction by the CPU.

A0 = 0

D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	D4	D3	D2	D1	D0

See Loading CGRAMs.

SPECIFICATIONS

Absolute Maximum Ratings

VSS = GND = 0 V and Ta = 25°C unless otherwise specified

Parameter	Symbol	Rating	Unit
Supply voltage (1)	VDD	–0.3 to +7.0	V
Supply voltage (2)	VLCD	VDD–7.0 to VDD+0.3	V
Input voltage	VIN	–0.3 to VDD+0.3	V
Output voltage	VOUT	–0.3 to VDD+0.3	V
Operating temperature	Topr	–20 to +70	°C
Storage temperature	Tstg	–60 to +150	°C
Soldering temperature and time	Tsol	260, 10	°C, s

Note: Exceeding the absolute maximum ratings can cause permanent damage to the device. Functional operation under these condition is not implied.

Read Commands

BUSY FLAG CHECK

Reading yields the status of the SED1210F.

$\overline{RD} = 0, A0 = 0$

D7	D6	D5	D4	D3	D2	D1	D0
BF	*	*	*	*	*	*	*

BF = 0: SED1210F READY

BF = 1: SED1210F BUSY

Bits D6–D0 are tristate during reads of the Busy Flag.

Mechanical Specifications

SED1210

OPERATION

Data Input/Output

New commands must not be written to the SED1210F if it is currently executing the last one, so the busy flag should be checked before commands are written.

If the busy flag is not going to be checked between writes of individual commands then the MPU must wait long enough to allow for command execution to complete. The maximum time taken by the SED1210F to execute a command is given by $16/\Phi$, where Φ is the system command clock frequency.

System Initialization

Figure 1 shows a flow chart of a possible SED1210F initialization sequence. Note that busy flag checks, and busy/wait loops have been omitted for the sake of brevity.

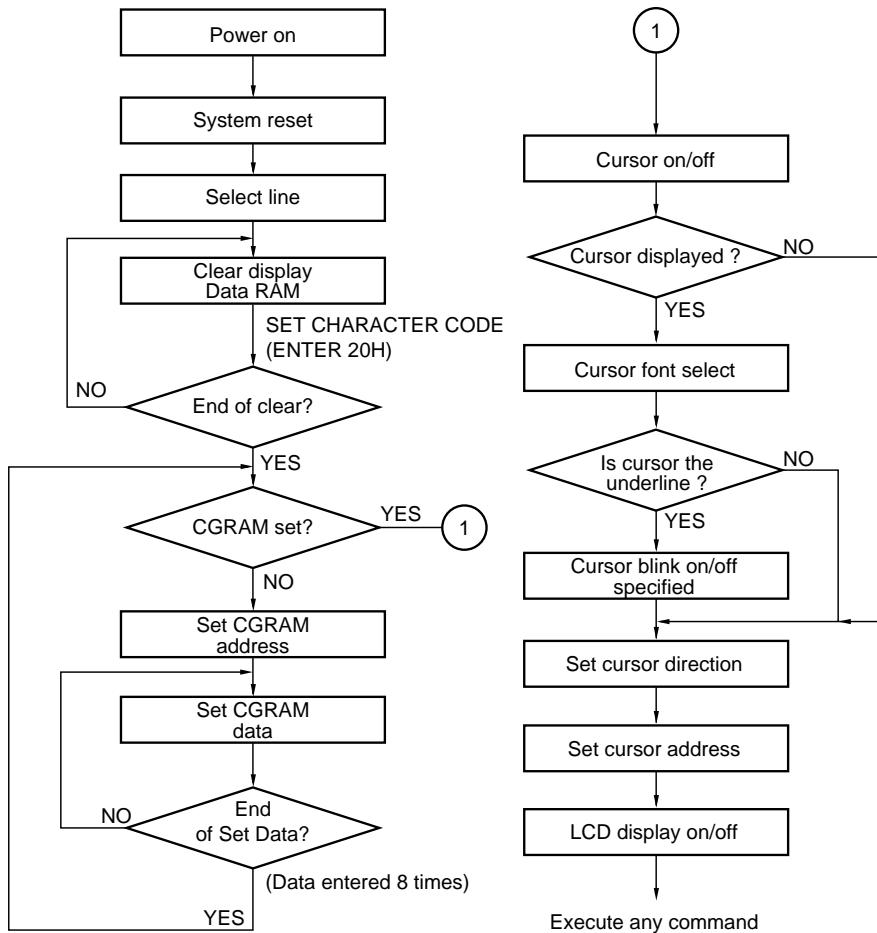

Figure 1. SED1210F Initialization

Loading CGRAM

The character generator RAM is loaded with a character bit pattern using a combination of one SET CGRAM ADDRESS command and eight SET CGRAM DATA commands. For example, to load the character shown in figure 2 into the area of CGRAM corresponding to character code 01H, the sequence shown below would be used.

	D4	D3	D2	D1	D0
Row 1					
Row 2					
Row 3					
Row 4					
Row 5					
Row 6					
Row 7					
Row 8					

Figure 2. User Defined Characters

Step	A0	\overline{WR}	Data	Action
1	0	0	21H	Set address of CGRAM 01
2	0	0	40H	Data for Row 1
3	0	0	41H	Data for Row 2
4	0	0	45H	Data for Row 3
5	0	0	49H	Data for Row 4
6	0	0	5FH	Data for Row 5
7	0	0	48H	Data for Row 6
8	0	0	44H	Data for Row 7
9	0	0	40H	Data for Row 8

- Notes:
1. These steps do not include any BUSY FLAG CHECK commands.
 2. Row 8 may be used by the underline cursor.

APPLICATION NOTES

Display Oscillator

The SED1210F has an internal oscillator to generate the timing signals required for the LCD display.

If the internal oscillator is used, connect the feedback resistor R_f as shown in figure 3. The feedback resistor leads must be kept as short as possible to reduce stray capacitance and the possibility of crosstalk between the oscillator and adjoining signals.

Figure 3. Using the Internal Oscillator

If an external clock is used, connect it to OSC1 as shown in figure 4.

Figure 4. Using an External Clock

The relationship between the oscillator frequency and the LCD drive frame frequency is

$$f_{FR} = f_{OSC}/1600$$

For example if $f_{OSC} = 100 \text{ kHz}$, $f_{FR} = 62.5 \text{ Hz}$

Command Clock (Φ)

When the system MPU issues a command to the SED1210F, the timing for the execution of the command is derived from Φ , the command clock. This would normally be the system MPU clock.

The maximum execution time for a command is given by $16/\Phi$. For example if $\Phi = 1 \text{ MHz}$, the maximum execution time for a command is $16 \mu\text{s}$.

LCD Drive Waveforms

The SED1210F has an internal low source-impedance voltage-driver shown in the figure below. The switches are closed to switch the segment data.

SED1210

Examples of drive waveforms are shown below.

- LCD Drive Waveform – 1 Line Display (1/8 Duty Cycle)

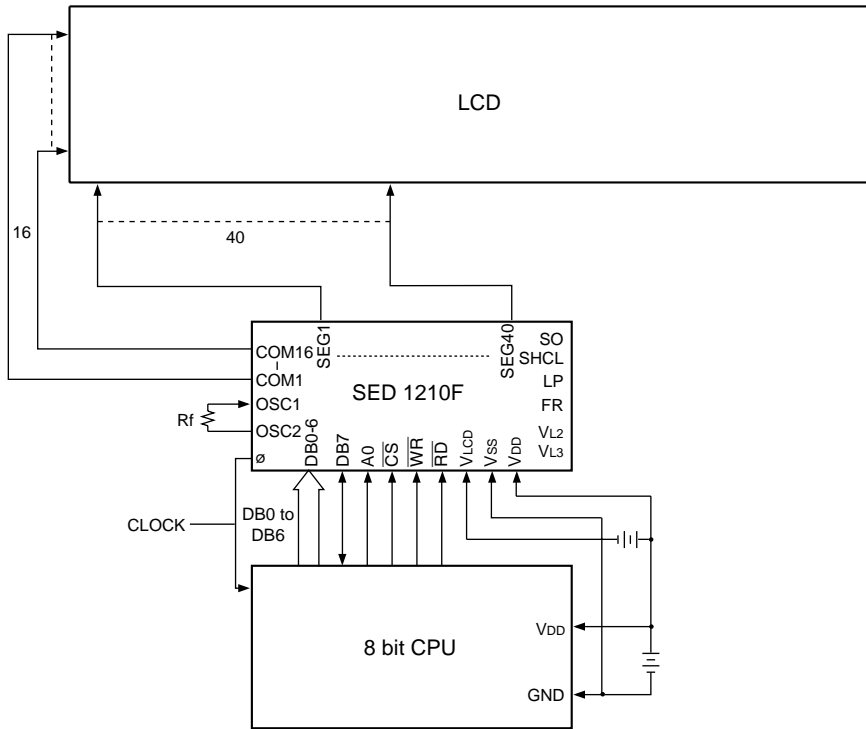

• LCD Drive Waveform – 2 Line Display (1/16 Duty Cycle)

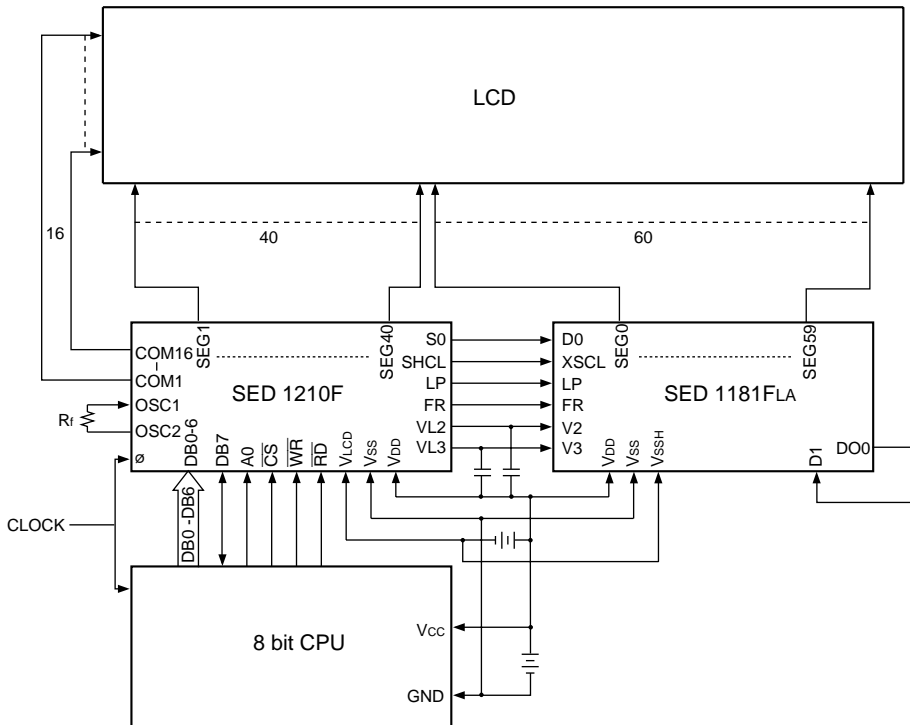

SED1210

LCD Display Interface

- 8 Characters/2 line

- 20 Characters/2 lines

- Interface with 8-bit CPU

OVERVIEW

SED1220 is a dot matrix LCD controller/driver for character display. Using 4bits data, 8bits data or serial data being provided from the micro computer, it displays up to 36 characters, 4 user defined characters and up to 120 symbols.

Up to 256 types of built-in character generator ROMs are prepared. Each character font is consisted of 5×8 dots. It also contains the RAM for displaying 4 user defined characters each font consisting of 5×8 dots. It is symbol register allows character display with high degree of freedom. This handy equipment can be operated with minimum power consumption with its low power consumption design, standby and sleeping mode.

FEATURES

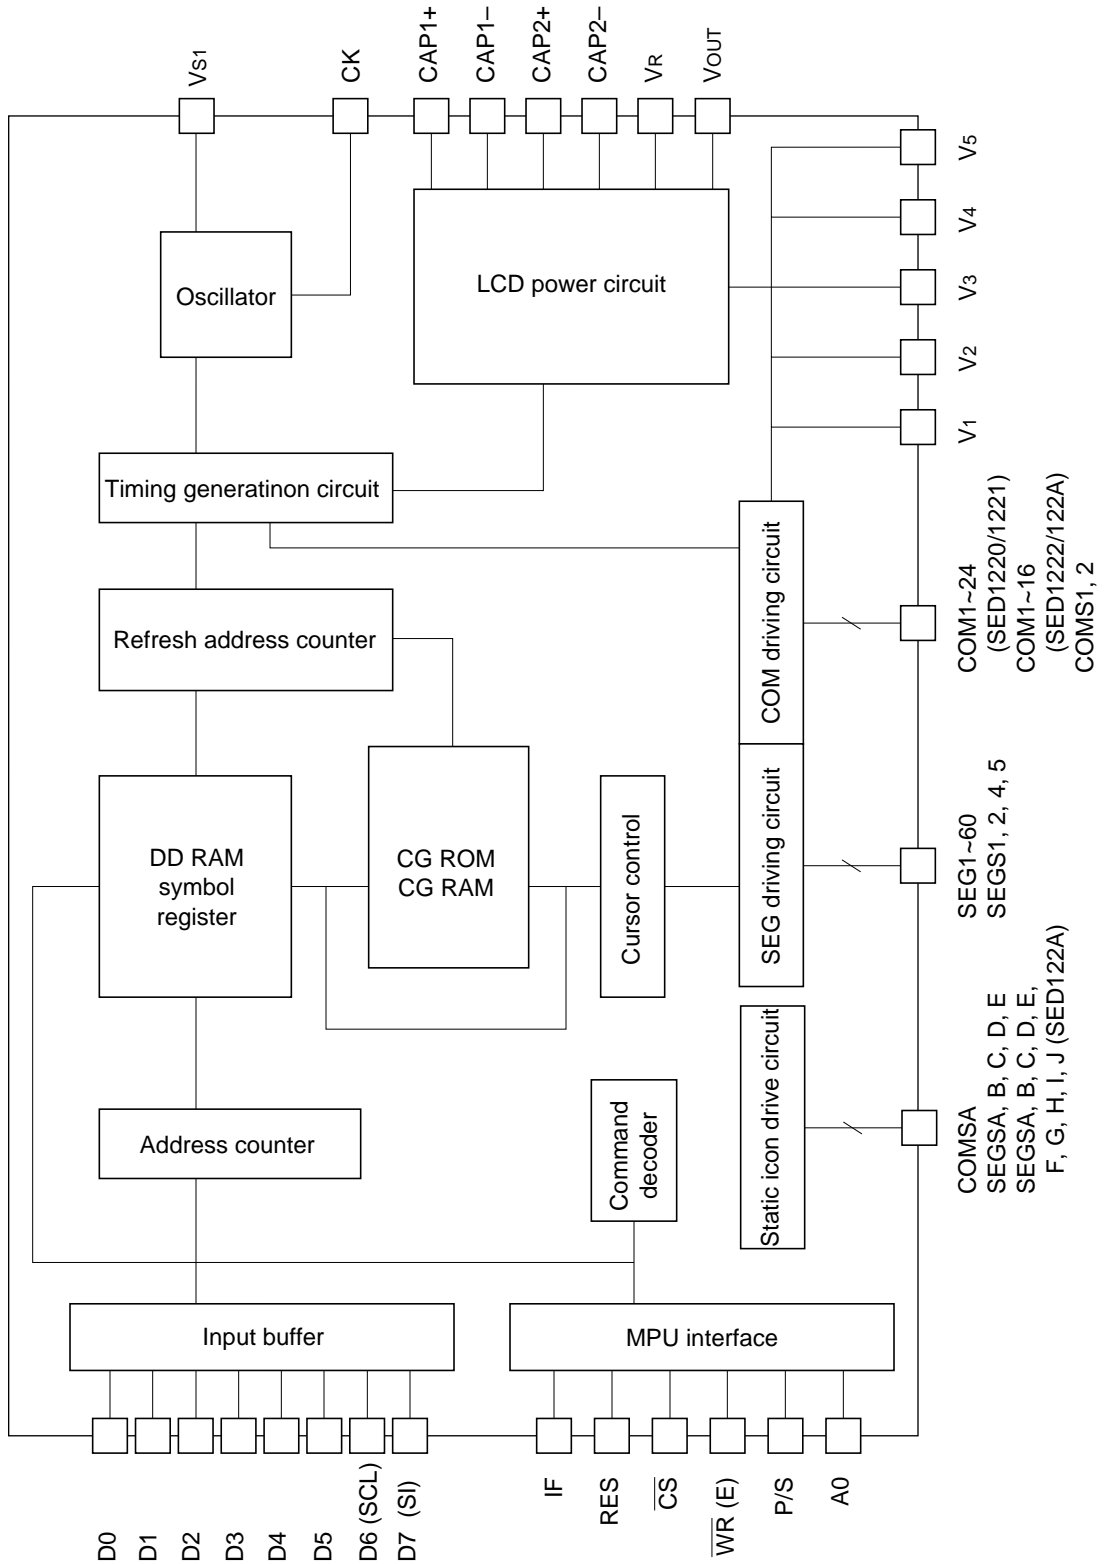

- Built-in data display RAM – 36 characters + 4 user defined characters + 120 symbols.
- CG ROM (For up to 256 characters), CG RAM (for 4 characters) and symbol register (for 120 symbols).
- No. of display digit and lines
 - < In normal mode >
 - ① (12 digits + 4 segments for signal) \times 3 lines + 120 symbols + 5 static symbols (SED1220D**)
 - ② (12 digits + 4 segments for signal) \times 2 lines + 120 symbols + 5 static symbols (SED1221D**)
 - ③ 12 digits \times 2 lines + 120 symbols + 5 static symbols (SED1222D**)
 - ④ (12 digits + 4 segments for signal) \times 2 lines + 120 symbols + 10 static symbols (SED122AD**)
 - < In standby mode >
 - ① 5 static symbols
 - ② 5 static symbols
 - ③ 5 static symbols
 - ④ 10 static symbols

- Built-in CR oscillation circuit (C and R contained)
- Accepts external clock input
- High-speed MPU interface
 - Affords interface with both 68/80 system MPUs
 - Affords interface through 4 bits and 8 bits
- Affords serial interface
- Character font consists of 5×8 dots
- Duty ratio
 - ① 1/26 (SED1220D**)
 - ② 1/18 (SED1221D**, SED1222D**)
- Simplified command setting
- Built-in power circuit for driving liquid crystal
 - Power amplifier circuit, power regulation circuit and voltage followers \times 4
- Built-in electronic volume function
- Low power consumption
 - 80 μ A max. (In normal operation, including operating current of the power supply).
 - 20 μ A max. (In standby mode for displaying static icon).
 - 5 μ A max. (In sleeping mode when display is turned off).
- Power supply

V _{DD} - V _{SS}	-2.4 V ~ -3.6 V
V _{DD} - V _S	-4.0 V ~ -6.0 V
- Temperature range for wide range operation
 - T_a = -30 ~ 85°C
- CMOS process
- Shipping style

Chip (Al pad product)	SED1222D*A
Chip (Au bump product)	SED122*D*B
TCP	SED122*T**
- This unit does not employ radiation protection design

BLOCK DIAGRAM

CHIP SPECIFICATION

SED1220D**/1221D**/122AD**

SED122*D**

Digits prepared for CGROM pattern changes

Chip size: 7.70 × 2.77 mm
 Pad pitch: 100 μm (Minimum)
 Chip thickness (for reference): 625 ± 25 μm (SED122*D*A)
 (SED122*D*B)

- 1) Al pad specifications
 - Pad size on Y side: 75 μm × 135 μm
 - Pad size on X side: 135 μm × 75 μm
- 2) Au bump specifications
 - Bump size on Y side: 69 μm × 129 μm
 - Bump size on X side: 129 μm × 69 μm
 - Bump height (for reference) 22.5 μm ± 5.5 μm

<Fuse Pines>

- 1) Al pad, pad size 86 μm × 75 μm
- 2) Au bump
 - Bump size 80 μm × 69 μm

↑

Digits prepared for CGROM pattern changes

Chip size: 7.70 × 2.77 mm
 Pad pitch: 124 μm (Minimum)
 Chip thickness (for reference): 625 ± 50 μm (SED1222D*A)

1) A1 pad specifications

Pad size on Y side: 90 μm × 96 μm
 Pad size on X side: 96 μm × 90 μm (PAD. No. 1 ~ 11, 28 ~ 32, 52 ~ 108)
 175 μm × 135 μm (PAD. No. 12 ~ 27)

<Fuse Pines>

1) A1 pad. pad size 86 μm × 75 μm

DESCRIPTION OF PINS

Power Pins

Pin name	I/O	Description	Q'ty
VDD	Power supply	Connected to logic supply. Common with MPU power terminal Vcc.	1
VSS	Power supply	0V power terminal connected to system ground.	1
V0, V1 V2, V3 V4, V5	Power supply	<p>Multi-level power supply for liquid crystal drive.</p> <p>The voltage determined in the liquid crystal cell is resistance-divided or impedance-converted by operational amplifier, and the resultant voltage is applied.</p> <p>The potential is determined on the basis of VDD and the following equation must be respected.</p> $V_{DD} = V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$ $V_{DD} \geq V_{SS} \geq V_5 \geq V_{OUT}$ <p>When the built-in power supply is ON, the following voltages are given to pins V1 to V4 by built-in power circuit:</p> $V_1 = 1/5 V_5 \quad (1/4 V_5)$ $V_2 = 2/5 V_5 \quad (2/4 V_5)$ $V_3 = 3/5 V_5 \quad (3/4 V_5)$ $V_4 = 4/5 V_5 \quad (4/4 V_5)$ <p>voltage ratings in () are for optimal choices.</p>	6
Vs1	O	Power supply voltage output pin for oscillating circuit, and DC/DC source. Don't connect this pin to an external load.	1

LCD Power Circuit Pins

Pin name	I/O	Description	Q'ty
CAP1+	O	Capacitor positive side connecting pin for boosting. This pin connects the capacitor with pin CAP1-.	1
CAP1-	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP+.	1
CAP2+	O	Capacitor positive side connecting pin for boosting. This pin connects a capacitor with pin CAP2-.	1
CAP2-	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP2+.	1
VOUT	O	Output pin for boosting. This pin connects a smoothing capacitor with VDD pin.	1
VR	I	Voltage regulating pin. This pin gives a voltage between VDD and V5 by resistance-division of voltage.	1

Pins for System Bus Connection

Pin name	I/O	Description	Q'ty

Liquid Crystal Drive Circuit Signals

Dynamic drive terminal (SED1220D**/1221D**/122AD**)

Pin name	I/O	Description	Q'ty
COM1~ COM24	○	Common signal output pin (for characters)	24
COMS1, CMOS2	○	Common signal output pin (except for characters) CMOS1, CMOS2: Common output for symbol display	2
SEG1~ SEG60	○	Segment signal output pin (for characters)	60
SEGS1, 2 4, 5	○	Segment signal output pin (except for characters) SEGS1, SEGS2: Segment output for signal output	4

Dynamic drive terminal (SED1222D**)

Pin name	I/O	Description	Q'ty
COM1~ COM16	○	Common signal output pin (for characters)	16
COMS1, CMOS2	○	Common signal output pin (except for characters) CMOS1, CMOS2: Common output for symbol display	2
SEG1~ SEG60	○	Segment signal output pin (for characters)	60

Static drive terminal

Pin name	I/O	Description	Q'ty
COMSA	○	Common signal output pin (for icon)	1
SEGSA, B C, D, E F, G, H, I, J	○	Segment signal output pin (for icon) SEGSF, G, H, I, J (only SED122A)	5 to 10

Note: For the electrode of liquid crystal display panel to be connected to the static drive terminal, we recommend you to use a pattern in which it is separated from the electrode connected to the dynamic drive terminal. When this pattern is too close to the other electrode, both the liquid crystal display and electrode will be deteriorated.

FUNCTIONAL DESCRIPTION

MPU Interface

Selection of interface type

In the SED1220 Series, data transfer is performed through a 8-bit or 4-bit data bus or a serial data input (SI). By selecting “High” or “Low” as P/S pin polarity, a parallel data input or a serial data input can be selected as shown in Table 1.

Table 1

P/S	Type	\overline{CS}	A0	\overline{WR}	SI	SCL	D0~D7
“High”	Parallel Input	\overline{CS}	A0	\overline{WR}	—	—	D0~D7
“Low”	Serial Input	\overline{CS}	A0	H, L	SI	SCL	—

Parallel Input

In the SED1220 Series, when parallel input is selected (P/S = “High”), it can be directly connected to the 80 series MPU bus or 68 series MPU bus, as shown in Table 2, if either “High” or “Low” is selected as RES pin polarity after a reset input, because the RES pin has an MPU select function.

Selection between 8 bits and 4 bits is performed by command.

Table 2

RES input polarity	Type	A0	\overline{WR}	\overline{CS}	D0~D7
↓ active	68 series	A0	E	\overline{CS}	D0~D7
↑ active	80 series	A0	\overline{WR}	\overline{CS}	D0~D7

Interface with 4-bit MPU interface

When data transfer is performed by 4-bit interface (IF = 0), an 8-bit command, data and address are divided into two parts.

Note: When performing writing in succession, reverse a time exceeding the system cycle time (t_{cyc}) and then perform writing.

Serial interface (P/S = “Low”)

The serial interface consists of a 8-bit shift register and a 3-bit counter and acceptance of an SI input or SCL input is enabled in the ship selected status (\overline{CS} = “Low”).

When no chip is selected, the shift register and counter are reset to the initial status.

Serial data is input in the order of D7, D6 ... D0 from the serial data input pin (SI) at the rise of Serial Clock (SCL).

At the rising edge of the 8th serial clock, the serial data is converted into 8-bit parallel data and this data is processed. The A0 input is used to identify whether the serial data input (SI) is display data or a command. That is, when A0 = “High”, it is regarded as display data. When A0 = “Low”, it is regarded as a command.

The A0 input is read in and identified at the rise of the 8 x n-th clock of Serial Clock (SCL) after chip selection.

Fig. 1 shows a timing chart of the serial interface.

Regarding the SCL signal, special care must be exercised about terminal reflection and external noise due to a wire length. We recommend the user to perform an operation check with a real machine.

We also recommend the user to periodically refresh the write status of each command to prevent a malfunction due to noise.

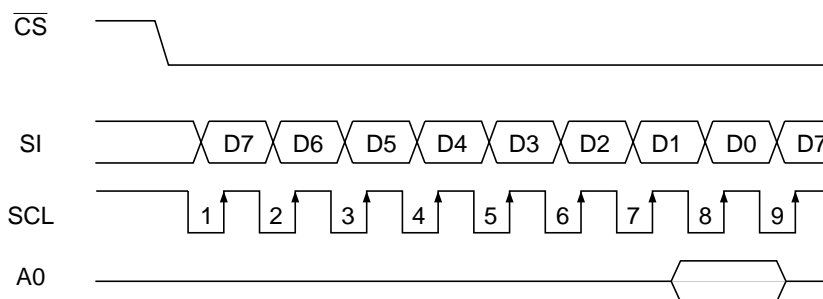

Fig. 1

Identification of data bus signals

The SED1220 series identifies data bus signals, as shown in Table 3, by combinations of A0 and \overline{WR} (E).

Table 3

Common	68 series	80 series	Function
A0	E	\overline{WR}	
1	1	0	Writing to RAM and symbol register
0	1	0	Writing to internal register (command)

Chip select

The SED1220 series has a chip select pin (\overline{CS}). Only when \overline{CS} = “Low”, MPU interfacing is enabled. In any status other than Chip Select, D0 to D7 and A0, \overline{WR} , SI and SCL inputs are invalidated. When a serial input interface is selected, the shift register and counter are reset.

However, the Reset signal is input regardless of the \overline{CS} status.

Power Circuit

This is a low-power-consumption power circuit that generates a voltage required for liquid crystal drive. The power circuit consists of a boosting circuit, voltage regulating circuit and voltage follower.

The power circuit incorporated in the SED1220 Series is set for a small-scale liquid crystal panel, so that its display quality may be greatly deteriorated if it is used for a liquid crystal panel with a large display capacity. In this case, an external power supply must be used.

A power circuit function can be selected by power control command. With this, an external power supply and a part of the internal power supply can be used together.

	Amplifying circuit	Voltage regulating circuit	Voltage follower	External voltage input	Amplifying system pin
	○	○	○	—	Per specification
Note 1	×	○	○	VOUT	OPEN
Note 2	×	×	○	V5 = VOUT	OPEN
Note 3	×	×	×	V1, V2, V3, V4, V5	OPEN

Note 1: When the boosting circuit is turned off, make boosting system pins (CAP1+, CAP1-, CAP2+, CAP2-) open and give a liquid crystal drive voltage to the VOUT pin from the outside.

Note 2: When the voltage regulating circuit is not used with the boosting circuit OFF, make the boosting system pins open, connect between the V5 pin and VOUT pin, and give a liquid crystal drive voltage from the outside.

Note 3: When all the internal power supplies are turned off, supply liquid crystal drive voltages V1, V2, V3, V4 and V5 from the outside, and make the CAP1+, CAP1-, CAP2+, CAP2- and VOUT pins open.

Voltage Tripler Circuit

If capacitors are connected between CAP+1 – CAP–1 and CAP2+,CAP2– and VSS VOUT, VDD– VSS potential is negatively tripled and generated at VOUT terminal. When the voltage is boosted double, open CAP2+ and

connect CAP2– to VOUT terminal.

At this time, the oscillating circuit must be operating since the amplifying circuit utilize the signal from the oscillation output.

Potential relationship of amplified voltage

Voltage regulating circuit

Amplified voltage generated at VOUT outputs liquid crystal drive voltage V5 through the voltage regulation circuit. V5 voltage can be obtained from the expression ① below by adjusting the resistors Ra and Rb within the range of V5<VOUT.calculated by the following formula:

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) \cdot V_{REG} \dots\dots\dots ①$$

Where, VREG is the constant power supply within IC. VREG is maintained constantly at VREG ≒ 2.0V. Voltage regulation of V5 output is done by connecting to a variable register between VR, VDD and V5. It is recommended to combine fixed registers R1 and R3 with variable resistor R2 for fine adjustment of V5 voltage.

[Sample setting on R1, R2 and R3]

- R1 + R2 + R3 = 1.2 M ohm (decided from the current value I05 passed between VDD – V5. Where, I05≦5 μA is supposed).
- Variable voltage range provided by R2 is from –4V to –6V (to be decided considering charecteristics of the liquid crystal).
- Since VREG = 2.0V, if the electronic volume register is set at (0, 0, 0, 0, 0), followings are derived from above conditions and expression ① :

- R1 = 400KΩ
- R2 = 200KΩ
- R3 = 600KΩ

The voltage regulation circuit outputs VREG with the temperature gradient of approximately –0.04%/°C. Since VR terminal has high input impedance, anti-noise measures must be considered including use of shortened wiring distance and shield wire.

● Voltage Regulation Circuit Using Electronic Volume Function

The electronic volume function allows to control the liquid crystal drive voltage V5 with the commands and thus to adjust density of the liquid crystal display. Liquid crystal drive voltage V5 can have one of 32 voltage values if 5-bit data is set to the electronic volume register.

When using the electronic volume function, you need to turn the voltage regulation circuit on using the supply control command.

[Sample constants setting when electronic volume function is used]

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) \cdot V_{EV} \quad \text{②}$$

Where $V_{EV} = V_{REG} - \alpha$

$$\alpha = V_{REG} / 150$$

No.	Electronic volume register	a	V5
0	(0, 0, 0, 0, 0)	0	Large
1	(0, 0, 0, 0, 1)	1α	•
2	(0, 0, 0, 1, 0)	2α	•
3	(0, 0, 0, 1, 1)	3α	•
•	•	•	•
•	•	•	•
30	(1, 1, 1, 1, 0)	(n-1)α	•
31	(1, 1, 1, 1, 1)	nα	Small

When the electronic volume function is not used, select (0, 0, 0, 0, 0) for the electronic volume register.

Liquid crystal voltage generating circuit

V5 potential is resistive divided within IC to produce V1, V2, V3 and V4 potentials required for driving the liquid crystal. V1, V2, V3 and V4 potentials are then subject to impedance conversion and provided to the liquid crystal drive circuit.

The liquid crystal drive voltage is fixed to 1/5 (1/4) bias. The liquid crystal power terminals V1 – V5 must be externally connected with the voltage regulating capacitor C2.

When a built-in supply is used
When voltage is doubled

When voltage is tripled

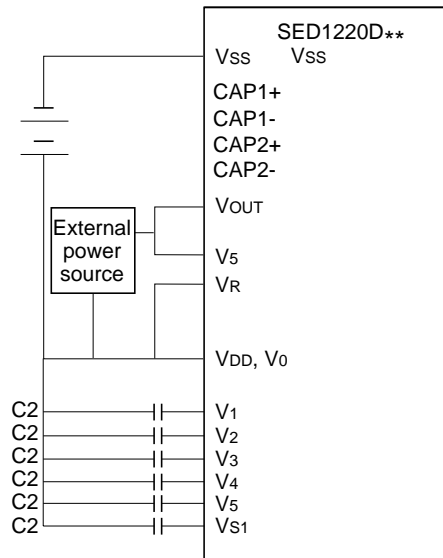

Reference setting values: C1: 0.1 - 4.7 μ F We recommend the user to set the optimum values to capacitors C1 and C2 according to the panel size watching the liquid crystal display and drive waveforms.
C2: 0.1 μ F

Example 2: When using the built-in power source
 (VC, VF, P) = (1, 1, 0)

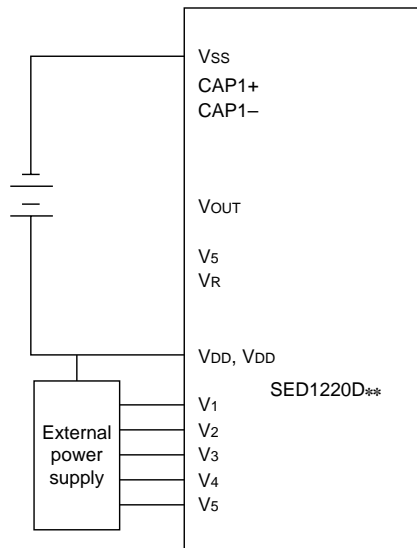

Example 3: When using the built-in power source
 (VC, VF, P) = (0, 1, 0)

Reference setting values: C1: 0.47 - 4.7 μF We suggest you to determine the most appropriate capacitance values, fitting to the panel size, for respective capacitors C1 and C2 in consideration of the liquid crystal display and drive waveforms.
 C2: 0.1 - 4.7 μF

When a built-in supply is used

Low Power Consumption Mode

SED1220 is provided with standby mode and sleep mode for saving power consumption during standby period.

● Standby Mode

Switching between on and off of the standby mode is done using the power save command.

In the standby mode, only static icon is displayed.

1. Liquid crystal display output
COM1 ~ COM24, COMS1, COMS2 : VDD level
SEG1 ~ SEG60, SEGS1, 2, 4, 5 : VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA: Can be turned on by static drives.
Use the static icon RAM for controlling the static icon display done with SEGSA, B, C, D, E, COMSA.
2. DD RAM, CG RAM and symbol register
Written information is saved as it is irrespective of on or off of the stand-by mode.
3. Operation mode is retained the same as it was prior to execution of the standby mode.
The internal circuit for the dynamic display output is stopped.
4. Oscillating circuit
The oscillation circuit for the static display must be remained on.

● Sleep Mode

To enter the sleep mode, turning off the power circuit and oscillation circuit using the commands, and then execute power save command. This mode helps to save power consumption by reducing current to almost resting current level.

1. Liquid crystal display output
COM1 ~ COM24, COMS1, COMS2 : VDD level
SEG1 ~ SEG60, SEGS1, 2, 4, 5 : VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA: Clear all the data of the static icon registers to "0".
2. DD RAM, CG RAM and symbol register
Written information is saved as it is irrespective of on or off the sleep mode.
3. Operation mode mode is retained the same as it was prior to execution of the sleep mode.
All internal circuits are stopped.
4. Power circuit and oscillation circuit
Turn off the built-in supply circuit and oscillation circuit using the power save command and supply control command.

Reset Circuit

Upon activation of the RES input, this LSI will be initialized.

● Initial State

1. Display on/off control
C = 0 : Cursor off
B = 0 : Blink off
D = 0 : Display off
2. Power save
O = 0 : Oscillation off
PS = 0 : Power save off
3. Supply control
VC = 0 : Voltage regulation circuit off
VF = 0 : Voltage follower off
P = 0 : Amplifying circuit off
4. System setting
N2, N1 = 0 : 2 lines
S = 0 : Left-hand shift
CG = 0 : "CGRAM" blank
5. Electronic volume control
Address : 28H
Data : (0, 0, 0, 0, 0)
6. Static icon
Address : 20H
Data : (0, 0, 0, 0, 0)
Address : 21H
Data : (0, 0, 0, 0, 0)
Address : 22H
Data : (0, 0, 0, 0, 0)
Address : 23H
Data : (0, 0, 0, 0, 0)

As explained in the Section "MPU interface", the RES terminal connects to the reset terminal of the MPU and initialization is being effected together with the MPU.

However, when the bus, port, etc. of the MPU maintains high-impedance for a certain duration of time after resetting, make the resetting input to the SED1220 after the inputs to the SED1220 have become definite.

As the resetting signal, like explained in the Section "DC characteristics", active level pulses of minimum 10us or more should be used. Normal operation status can be obtained after 1us from the edge of the RES signal.

By making the RES terminal active, respective registers can be cleared and the aforesaid setting state can be obtained.

If initialization is not effected by the RES terminal when the supply voltage is applied, it may go into a state where cancellation is unworkable.

In case the built-in liquid crystal power circuit will not be used, it becomes necessary that the RES input be active when the external liquid crystal power is being applied.

COMMAND

Table 4 lists the commands. SED1220 identifies the data bus signal using different combinations of A0 and WR (E). High speed command interpretation and execution are possible since only the internal timing is used.

• **Command Overview**

Command type	Command name	A0	WR
Display control instruction	Cusor Home	0	0
	Display ON/OFF Control	0	0
Power control	Power Save	0	0
	Power Control	0	0
System set	System set	0	0
Address control instruction	Address Set	0	0
Data input instruction	Data Write	1	0

Instruction execution duration of depends on the internal process time of SED1220, therefore it is necessary to provide a duration larger than the system cycle time (tCYC) between execution of two successive instruction.

• **Description of Commands**

(1) **Cursor Home**

This command presets the address counter to 30H and moves the cursor, when it is present, to the first digit of the first line.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	*	*	*	*

*: Don't Care

(2) **Display ON/OFF Control**

This command performs on or off of display and cursor setting.

Note: Symbols driven by COMSA and SEGSA – E must be controlled through the static icon RAM.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	C	B	*	D

D = 0 : Display off
1 : Display on

B = 0 : Cursor blink off
1 : Cursor blink on

Blink displays characters in black and white, alternately. The alternating display will be repeated with approx. 1 second interval.

C = 0 : Display of cursor
1 : Does not display

Following table shows relationship between B and C registers and the cursor.

C	B	Cursor display
0	0	Non-display
0	1	Non-display
1	0	Underbar cursor
1	1	Alternate display of display characters in black and white. The cursor position indicates the position of address

The cursor position indicates the position of address counter.

Therefore, whenever moving the cursor, change the address counter value using the RAM address set command or the auto increment done by writing the RAM data.

ISelective flashing symbol display is possible by selecting (C, B) = (1, 0) and thus locating the address counter to the position of the symbol register through selecting (since the symbol is corresponding to the character at each 5 dots).

(3) **Power Save**

This command is used to controlling the oscillation circuit and setting or resetting the sleep mode.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	*	*	O	PS

*: Don't Care

PS = 0 : Power save off (reset)
1 : Power save on (set)

O = 0 : Oscillating circuit off (stop of oscillation)
1 : Oscillating circuit on (oscillation)

(4) **Supply Control**

This command is used for controlling operation of the built-in power circuit.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	1	0	VC	VF	P

P = 0 : Amplifying circuit off
1 : Amplifying circuit on

Note: The oscillation circuit must be turned on for the amplifying circuit to be active.

VF = 0 : Voltage follower off
 1 : Voltage follower on

VC = 0 : Voltage regulation circuit off
 1 : Voltage regulation circuit on

- (5) System Set
 This command is used for selecting display line, common shift direction and use/non-use of CR RAM.
When power on or resetting is done, execute this command first.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	1	0	N1	N2	S	CG

* : Don't Care

N2, N1 = 0, 0 : 2lines
 N2, N1 = 0, 1 : 3lines

S = 0 : COM left shift
 = 1 : COM right shift

CG = 0 : Use CG RAM
 1 : Does not use RAM

- (6) RAM Address Set
 This command sets addresses to write data into the DD RAM, CG RAM and symbol register in the address counter.

When the cursor is displayed, the cursor is displayed at the display position corresponding to the DD RAM address set by this command.

A0	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	0	1	ADDRESS							

- ① The settable address length is ADDRESS = 00H to 7FH.
- ② Before writing data into the RAM, set the data write address by this command. Next, when data is written in succession, the address is automatically incremented.

RAM Map

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F	
00H	CGRAM (00H)						-	CGRAM (01H)						-			
10H	CGRAM (02H)						-	CGRAM (03H)						-			
20H	SI							-	EV	Test							-
30H	DDRAM line 1						For signals						Unused				
40H	DDRAM line 2												"				
50H	DDRAM line 3												"				
60H	Symbol register												"				
70H	Symbol register												"				

- :Unused
 For signals :Output from SEGS1 to SEGS2, SEGS4, SEGS5
 For symbol register :Output from COMS1 to COMS2.

SI :Static icon register
 EV :Electronic volume register
 Test :Test register (Do not use)

(7) Data Write

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
1	0	DATA							

- ① This command writes data the DD RAM, CG RAM or symbol register.
- ② This command automatically increases the address counter by +1, thus enabling continuous writing of data.

<Example of Data Writing>

Following figures illustrates an example of continuous writing of one line data to DD RAM.

Note: When executing instructions in succession, reserve a time exceeding t_{cv} and execute the next instruction.

Table 4 SED1220 Series Command List

Command	Code											Function	
	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0			
(1) Cursor Home	0	0	0	0	0	1	*	*	*	*		Moves the cursor to the home position.	
(2) Display ON/OFF Control	0	0	0	0	1	1	C	B	*	D		Sets cursor ON/OFF (C), cursor blink ON//OFF (B), and display ON/OFF (D). C = 1 (cursor ON) 0 (cursor OFF), B = 1 (blink ON) 0 (blink OFF), D = 1 (display ON) 0 (display OFF)	
(3) Power Save	0	0	0	1	0	0	*	*	0	PS		Sets power save ON/OFF (PS) and oscillating circuit ON/OFF (O). PS = 1 (power save ON) 0 (power save OFF), O = 1 (oscillating circuit ON) 0 (oscillating circuit OFF)	
(4) Power Control	0	0	0	1	0	1	0	VC	VF	P		Sets voltage regulating circuit ON/OFF and boosting circuit ON/OFF (P). VC = 1 (voltage regulating circuit ON) 0 (voltage regulating circuit OFF) VF = 1 (voltage follower ON) 0 (voltage follower OFF), P = 1 (boosting circuit ON) 0 (boosting circuit OFF)	
(5) System Set	0	0	0	1	1	0	N2	N1	S	CG		Sets the use or non-use of CG RAM and shifting direction of display line (N1, N2) and COM CG = 1 (use of CG RAM), 0 = (Does not use CG RAM), M2, N1 = 0, 0 (2 lines) 0, 1 (3 lines). S = 0 (left shift), 1 (right shift).	
(6) RAM Address Set	0	0	1	ADDRESS									Sets the DD RAM, CG RAM or symbol register address.
(7) RAM Write	1	0	DATA									Writes data into the DD RAM, CG RAM or symbol register address.	
(8) NOP	0	0	0	0	0	0	0	0	0	0		Non-operation command	
(9) Test Mode	0	0	0	0	0	0	*	*	*	*		Command for IC chip test. Don't use this command.	

CHARACTER GENERATOR

Character Generator ROM (CG ROM)

Character Generator ROM (CG ROM)
 SED1220 contains the character generator ROM (CG ROM) consisted of up to 256 types of characters.
 Character size is 5 × 8 dots.
 Tables 5 through 7 show the SED1220** character code.
 Concerning the 4 characters from 00H through 03H, the

system command selects on which of CG ROM and CG RAM they are to be used.
 SED1220 CG ROM is mask ROM and compatible with customized ROM. Contact us for its use in your system.
 Product name of modified CG ROM is defined as below:

(Example) S E D 1 2 2 0 D 0 B
 ↑

SED1220

Character Generator RAM (CG ROM)

CGRAM contained in SED1220 enables user programming of character patterns for display signals with higher degrees of freedom.

When using CGRAM, select it using the system command.

Capacity of CGRAM is 160 bits and accepts registration of any 4 5 × 8 dots patterns.

Following shows relationship between the CGRAM characters, CGRAM addresses and character code.

Character code	RAM address	CGRAM data (character pattern)								Character display	Signal display	
		D7							D0			SEG
00H 02H	00H~07H 10H~17H	0	*	*	*	0	1	1	1	1		
		1	*	*	*	1	0	0	0	0		
		2	*	*	*	1	0	0	0	0		
		3	*	*	*	0	1	1	1	1		
		4	*	*	*	0	0	0	0	1		
		5	*	*	*	0	0	0	0	1		
		6	*	*	*	1	1	1	1	0		
		7	*	*	*	0	0	0	0	0		
01H 03H	08H~0FH 18H~1FH	8	*	*	*	0	0	1	0	0		
		9	*	*	*	0	0	1	0	0		
		A	*	*	*	0	1	1	1	0		
		B	*	*	*	0	1	1	1	0		
		C	*	*	*	0	1	1	1	0		
		D	*	*	*	1	1	1	1	1		
		E	*	*	*	0	0	0	0	0		
		F	*	*	*	0	0	0	0	0		

Unused				Character data			
				1: Display			
				0: Non-display			

It is possible to set a 5 × 8 character size in this system. In this case, use the *7H/*FH RAM. Note that the *7H/*FH data is inverted when a under-bar cursor is used.

Symbol Register

SED1220 contains the symbol register which enable individual symbol setting for displaying on the screen.

Capacity of the symbol register is 120 bits and is capable of displaying up to 120 symbols.

Following shows relationship between the symbol register display patterns, RAM addresses and written data.

RAM address	Symbol Bits										
	D7					D0					
60H~6BH	0	*	*	*	1	2	3	4	5		
	1	*	*	*	6	7	8	9	10		
	:	:									
	B	*	*	*	56	57	58	59	60		
70H~7BH	0	*	*	*	61	62	63	64	65		
	1	*	*	*	66	67	68	69	70		
	:	:									
	B	*	*	*	116	117	118	119	120		

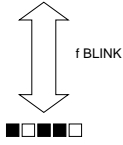

Note: When the symbol is 1.5 times or more than the character, it is recommended to drive it using both COMS1 and COMS2.

Static Icon Ram

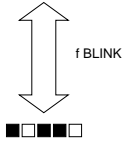

SED1220 contains the static icon RAM for displaying the static icons in addition to the dynamic icons. Capacity of static icon RAM is 10 bits (SED1220/1221/1222) or 20 bit (SED122A) and is capable of displaying

up to 5 icons (SED1220/1221/1222) or 10 icons (SED122A). Following shows relationship between the static icons functions, static icon RAM addresses and written data.

< SEGSA, B, C, D, E >

Function	RAM address	Static icon data								Display
		D7							D0	
Display On/Off	20H	*	*	*	0	0	1	1	1	SEGSABCDE 
Blink On/Off	21H	*	*	*	1	0	0	0	1	 fBLINK 

< SEGSG, G, H, I, J >

Function	RAM address	Static icon data								Display
		D7							D0	
Display On/Off	22H	*	*	*	0	0	1	1	1	SEGSFGHIJ 
Blink On/Off	23H	*	*	*	1	0	0	0	1	 fBLINK 

*: Blank
 1: Display or blink on
 0: Display or blink off
 fBLINK: 1-2 Hz

Electronic Volume RAM (register)

SED1220 contains the electronic volume function for controlling the liquid crystal drive voltage V5 and density of liquid crystal display. The electronic volume function enables to select one of 32 voltage status of the liquid

crystal drive voltage V5 by writing 5-bit data to the electronic volume RAM. Following shows relationship between RAM addresses set by the electronic volume and written data.

Function	RAM address	Electronic volume data								Condi-tion	VEV
		D7							D0		
Electronic volume data	28H	*	*	*	0	0	0	0	0	0	VREG-0
		*	*	*	0	0	0	0	1	1	VREG- α
		*	*	*	0	0	0	0	0	2	VREG- 2α
		:	:	:	:	:	:	:	:	:	:
		*	*	*	1	1	1	0	1	29	VREG- 29α
		*	*	*	1	1	1	1	0	30	VREG- 30α
	*	*	*	1	1	1	1	1	31	VREG- 31α	
	29H	*	*	*	*	*				For testing	

* : Blank
 Note : Do not use the address "29H". It is for testing
 $\alpha = VREG/150$

ABSOLUTE MAXIMUM RATINGS

Item	Symbol	Standard value	Unit
Power supply voltage (1)	V _{SS}	-6.0~+0.3	V
Power supply voltage (2)	V ₅ , V _{out}	-7.0~+0.3	V
Power supply voltage (3)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ ~+0.3	V
Input voltage	V _{IN}	V _{SS} -0.3~+0.3	V
Output voltage	V _O	V _{SS} -0.3~+0.3	V
Operating temperature	T _{opr}	-30~+85	°C
Storage temperature	TCP	T _{str}	°C
	Bare chip		
		-55~+100	
		-65~+125	

- Notes:
1. All the voltage values are based on V_{DD} = 0 V.
 2. For voltages of V₁, V₂, V₃ and V₄, keep the condition of V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V₅ and V_{DD} ≥ V_{SS} ≥ V₅ ≥ V_{OUT} at all times.
 3. If the LSI is used exceeding the absolute maximum ratings, it may lead to permanent destruction. In ordinary operation, it is desirable to use the LSI in the condition of electrical characteristics. If the LSI is used out of this condition, it may cause a malfunction of the LSI and have a bad effect on the reliability of the LSI.

DC CHARACTERISTICS

V_{DD} = 0 V, V_{SS} = -3.6 V to -2.4 V, Ta = -30 to 85°C unless otherwise specified.

Item	Symbol	Condition	min	typ	max	Unit	Applicable pin	
Power supply voltage (1)	Operatable	V _{SS}	-3.6	-3.0	-2.4	V	V _{SS} *1	
	Data retain voltage		-3.6		-2.0			
Power supply voltage (2)	Operatable	V ₅	-7.0		-4.0	V	V ₅ *2	
	Operatable	V ₁ , V ₂	0.6×V ₅		V _{DD}	V	V ₁ , V ₂	
	Operatable	V ₃ , V ₄	V ₅		0.4×V ₅	V	V ₃ , V ₄	
High-level input voltage	V _{IHC}		0.2×V _{SS}		V _{DD}	V	*3	
Low-level input voltage	V _{ILC}		V _{SS}		0.8×V _{SS}	V	*3	
Input leakage current	I _{LI}	V _{IN} = V _{DD} or V _{SS}	-1.0		1.0	μA	*3	
LC driver ON resistance	R _{ON}	Ta=25°C V ₅ =-7.0V ΔV=0.1V		20	40	KΩ	COM,SEG *4	
Static current consumption	I _{DDQ}			0.1	5.0	μA	V _{DD}	
Dynamic current consumption	I _{DD}	Display state	V ₅ = -6 V without load			80	μA	V _{DD} *5
		Standby state	Oscillation ON, Power OFF, V _{SS} = -3V without load			20	μA	V _{DD}
		Sleep state	Oscillation OFF, Power OFF, V _{SS} = -3.0V			5	μA	V _{DD}
		Access state	f _{cyc} =200KHz, V _{SS} = -3.0V			500	μA	V _{DD} *6
Input pin capacity	C _{IN}	Ta=25°C f=1MHz		5.0	8.0	pF	*3	

Frame frequency	f _{FR}	Ta=25°C V _{SS} =-3.0V	70	100	130	Hz	*10
External clock frequency	f _{ck}	Display of 2 lines		23.4		KHz	*10 *11
	f _{ck}	Display of 3 lines		33.8		KHz	*10 *11

Reset time	t _R		1.0			μs	*7
Reset pulse width	t _{RW}		10			μs	*8
Reset start time	t _{RES}		50			ns	*8

Dynamic system

Built-in power supply	Input voltage	V _{S1}		-2.3	-2.1	-1.9	V	*9
	Amplified voltage output voltage	V _{OUT}	When voltage is tripled	-6.9	-6.3	-5.7	V	V _{OUT}
	Voltage follower operating voltage	V ₅		-7.0		-4.0	V	
	Reference voltage	V _{REG}	Ta = 25°C	-2.06	-2.0	-1.94	V	

*1: A wide operating voltage range is guaranteed but an abrupt voltage variation in the access status of the MPU is not guaranteed.

*2: When the voltage is Tripled, care must be paid to supply the voltage V_{SS} so that operating voltage of V_{OUT} and V₅ may not be exceeded.

*3: D0 ~ D5, D6 (SCL), D7 (SI), A0, RES, \overline{CS} , \overline{WR} (E), P/S, IF

*4: This is a resistance value when a voltage of 0.1 V is applied between output pin SEG_n, SEG_S_n, COM_n or COM_S_n, and each power pin (V₁, V₂, V₃ or V₄). It is specified in the range of operating voltage (2).

$$R_{ON} = 0.1 \text{ V} / \Delta I$$

(ΔI: Current flowing when 0.1 V is applied between the power and output)

*5: Character “” display. This is applicable to the case where no access is made from the MPU and the built-in power circuit and oscillating circuit are in operation.

*6: Current consumption when data is always written by f_{cyc} .
The current consumption in the access state is almost proportional to the access frequency (f_{cyc}).
When no access is made, only I_{DD} (I) occurs.

*7: t_R (reset time) indicates the internal circuit reset completion time from the edge of the RES signal. Accordingly, the SED1220 usually enters the operating state after t_R .

*8: Specifies the minimum pulse width of the RES signal. It is reset when a signal having the pulse width greater than t_{RW} is entered.

*9: When operating the boosting circuit, the power supply V_{SS} must be used within the input voltage range.

*10: The f_{OSC} frequency of the oscillator circuit for internal circuit drive may differ from the f_{BST} boosting clock on some models. The following provides the relationship between the f_{OSC} frequency, f_{BST} boosting clock, and f_{FR} frame frequency.

$$f_{OSC} = (\text{No. of digits}) \times (1/\text{Duty}) \times f_{FR}$$

$$f_{BST} = (1/2) \times (1/\text{No. of digits}) \times f_{OSC}$$

*11: When performing the operations using an external clock, not taking advantage of the built-in oscillation circuit, input the waveforms indicated below. Meanwhile, while using an external clock but when clock inputs are not being made, fix it to “H”. (Normal High)

<Incase the external clock = f_{OSC} >

- Duty = $(t_h/t_{osc}) \times 100 = 20 \sim 30\%$
- $f_{OSC} = 1/t_{osc}$

<Incase the external clock = $4 \times f_{OSC}$ >

- Duty = $(t_h/t_{osc}) \times 100 = 50\%$
- $f_{OSC} = 1/t_{osc}$

TIMING CHARACTERISTICS

(1) MPU Bus Write Timing (80 series)

[Ta = -30 to 85°C, Vss = -3.6 V to -2.4 V]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address hold time	A0, CS	tAH8	Every timing is specified on the basis of 20% and 80% of Vss.	30	—	ns
Address setup time		tAW8		60	—	ns
CS setup time		tAC8		0	—	ns
System cycle time	WR	tCYC8		650	—	ns
Write "L" pulse width (WR)		tCCL		150	—	ns
Write "H" pulse width (WR)		tCCH		450	—	ns
Data setup time	D0 ~ D7	tDS8	100	—	ns	
Data hold time		tDH8	50	—	ns	

[Ta = -30 to 85°C, Vss = -3.3 V to -2.7 V]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address hold time	A0, CS	tAH8	Every timing is specified on the basis of 20% and 80% of Vss.	10	—	ns
Address setup time		tAW8		60	—	ns
CS setup time		tAC8		0	—	ns
System cycle time	WR	tCYC8		500	—	ns
Write "L" pulse width (WR)		tCCL		100	—	ns
Write "H" pulse width (WR)		tCCH		350	—	ns
Data setup time	D0 ~ D7	tDS8	100	—	ns	
Data hold time		tDH8	20	—	ns	

*1: For the rise and fall of an input signal (tr and tf), set a value not exceeding 25ns (excluding RES input).

*2: tCCL is specified based on an overlap period of CS and WR "L" levels.

(2) MPU Bus Write Timing (68 series)

[Ta = -30 to 85°C, Vss = -3.6 V to -2.4 V]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address setup time	A0, CS	tAW6	Every timing is specified on the basis of 20% and 80% of Vss.	60	—	ns
Address hold time		tAH6		30	—	ns
CS setup time		tAC6		0	—	ns
System cycle time	WR	tCYC6		650	—	ns
Enable "L" pulse width (WR)		tEWL		150	—	ns
Enable "H" pulse width (WR)		tEWH		450	—	ns
Data setup time	D0 ~ D7	tDS6		100	—	ns
Data hold time		tDH6		50	—	ns

[Ta = -30 to 85°C, Vss = -3.3 V to -2.7 V]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address setup time	A0, CS	tAW6	Every timing is specified on the basis of 20% and 80% of Vss.	60	—	ns
Address hold time		tAH6		10	—	ns
CS setup time		tAC6		0	—	ns
System cycle time	WR	tCYC6		500	—	ns
Enable "L" pulse width (WR)		tEWL		100	—	ns
Enable "H" pulse width (WR)		tEWH		350	—	ns
Data setup time	D0 ~ D7	tDS6		100	—	ns
Data hold time		tDH6		20	—	ns

*1: For the rise and fall of an input signal (tr and tf), set a value not exceeding 25ns (excluding RES input).

*2: tEWH is specified based on an overlap period of CS "L" and E "H" levels.

(3) Serial Interface

[Ta = -30 to 85°C, Vss = -3.6 V to -2.4 V]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
System clock cycle	SCL	tSCYC	Every timing is specified on the basis of 20% and 80% of Vss.	1000		ns
SCL "H" pulse width		tSHW		300		ns
SCL "L" pulse width		tSLW		300		ns
Address setup time	A0	tsAS		50		ns
Address hold time		tsAH		300		ns
Data setup time	SI	tSDS		50		ns
Data hold time		tSDH		50		ns
CS-SCL time	CS	tCSS	150		ns	
		tCSH	700		ns	

*1: For the rise and fall of an input signal (tr and tf), set a value not exceeding 25ns (excluding RES input).

MPU INTERFACE (REFERENCE EXAMPLES)

The SED1220 Series can be connected to the 80 series MPU and 68 series MPU. When an serial interface is used, the SED1220 Series can be operated by less signal lines.

LIQUID CRYSTAL DRIVE WAVEFORMS (B WAVEFORMS)

Instruction Setup Example (Reference Only)

(1) Initial setup

(2) Display mode

Notes 1) Commands (6) and (7) initialize the RAM. The display contents must first be set. The non-display area must satisfy the following conditions (for RAM clear).

- DDRAM: Write the 20H data (character code).
- CGRAM: Write the 00H data (null data).
- Symbol register: Write the 00H data (null data).

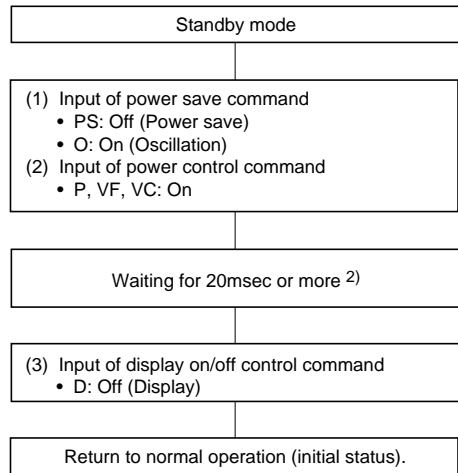

As the RAM data is unstable during reset signal input (after power-on), null data must be written. If not, unexpected display may result.

- 2) Since it is specified based on rise characteristics of the booster, power control and voltage follower circuits, time to be set differs depending on external capacity. Be sure to set it after the external capacity is confirmed.
- 3) A display of the dynamic drive series is turned on when the on command is input and the static icon is turned on using the static icon control command.
To turn both on at the same time when the display is turned on, execute display on/off command and static icon control within 1 frame period.

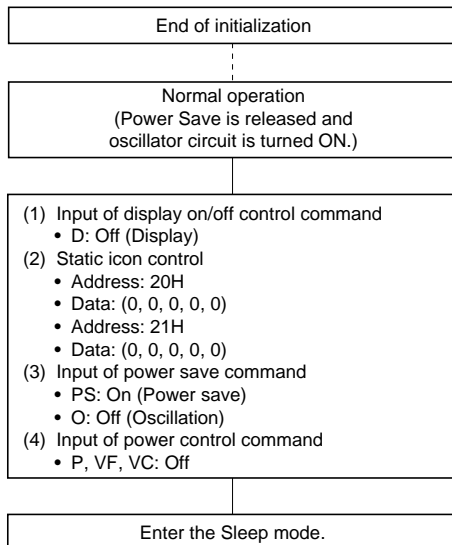

(3-1) Selecting the Standby mode

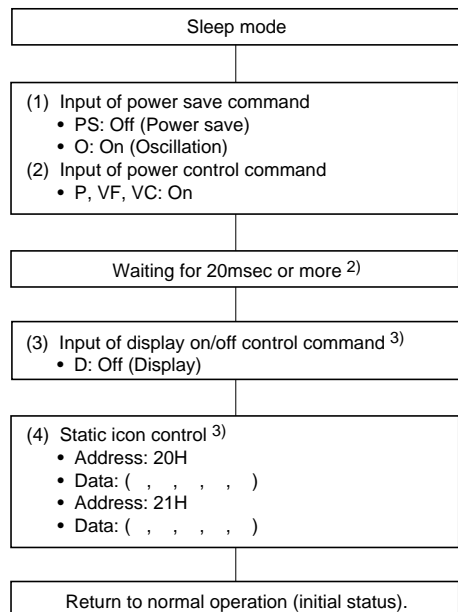

(3-2) Releasing the Standby mode

(4-1) Selecting the Sleep mode

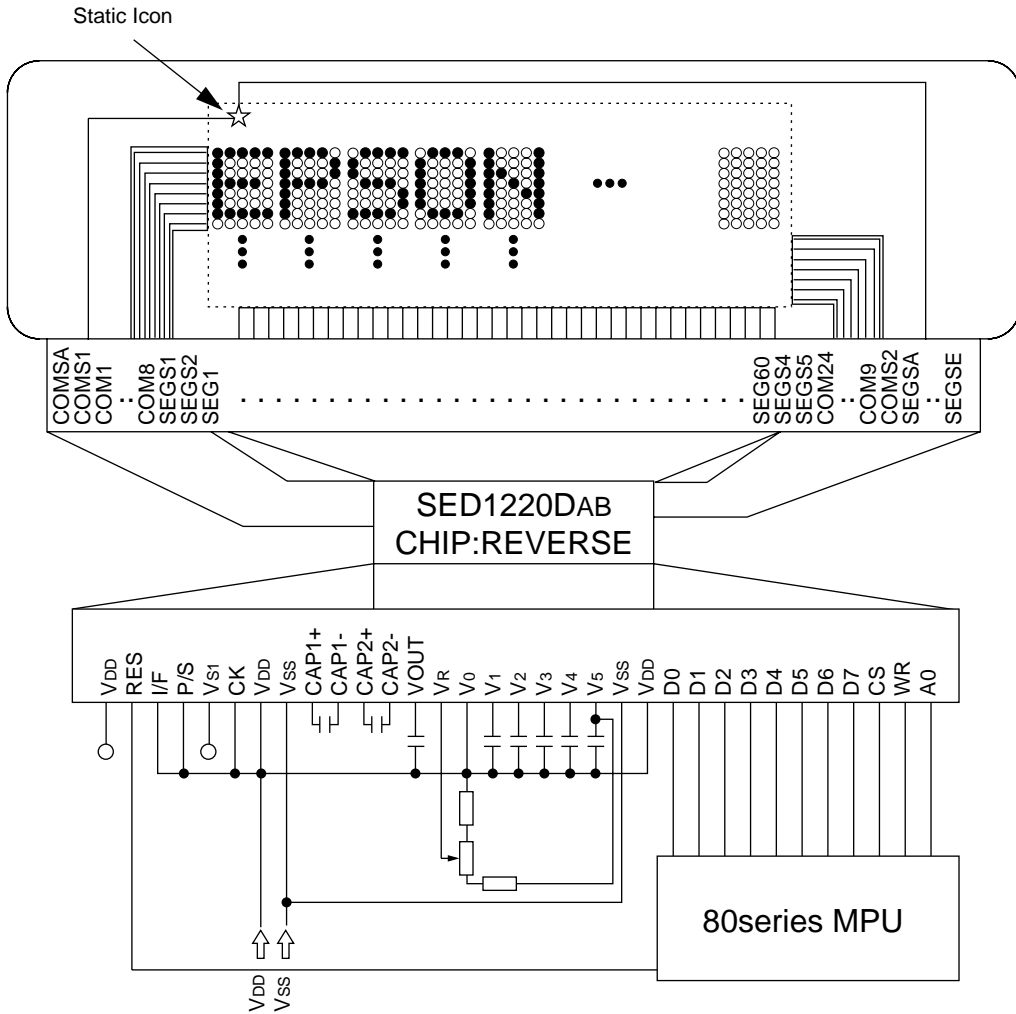

(4-2) Releasing the Sleep mode

Instruction Setup Example of SED1220 series

Option List

SED1220 provides the optional functions as described in the following. Being adaptable to the customer's optional demand, contact the Business Department of our company when installed.

- Our product name corresponding to a customer's option is defined as shown below:

1. Specification of Character Generator ROM (CGROM)

SED1220 integrates a character generator ROM which can generate a maximum of 256 type characters. The size of these characters is composed of 5 × 7 (8) dots.

Being a mask ROM, the SED1220 CGROM is adaptable to the character generator ROM exclusive for the customer, too.

For our standard CGROMs, refer to the Character Fonts Table.

2. Specification of Liquid Crystal Driver Voltage Bias Value.

SED1220 integrates a liquid crystal driver voltage generator circuit. Its 5-volt potential is divided into resistance inside of IC to generate 1-V, 2-V, 3-V or 4-V potential as required for the liquid crystal driver. Further, the 1-V, 2-V, 3-V or 4-V potential is converted into impedance by a voltage follower to be supplied to the liquid crystal driver circuit.

Either 1/5 or 1/4 bias value can be selected as demanded by the customer.

Our standard bias value is preset to 1/5.

3. Specification of Reference Voltage of Liquid Crystal Driver Voltage Regulation Circuit.

SED1220 integrates a voltage regulation circuit using a booster voltage as its power supply to generate 5V for the liquid crystal driver via the voltage regulation circuit.

The voltage regulation circuit integrates a reference voltage regulator VREG.

The customer can select a specification of using either the internal reference voltage or external VSS reference voltage.

Our standard specification is preset to the internal reference voltage.

4. Power Supply to Booster Circuit

SED1220 integrates a booster circuit.

The customer can select a specification of using either the regulator output VS1 or VSS as the supply voltage to the booster circuit.

Our standard specification is preset to the regulator output VS1.

5. External Clock Specifications

SED1220 integrates an external clock terminal and there are two clock specifications, f and 4×f oscillation.

Either of them can be selected on your request.

	Internal oscillation	External clock f osc.	External clock 4×f osc.
Standard	○	○	×
Optional	○	×	○

The standard external clock specification is set to fosc.

6. Reset Signal Input Polarity Specifications

SED1220 inputs reset signal from the reset terminal using edge detection and I/F specification 80/68 series can be selected according to this signal level. RES input polarity can also be selected on your request.

RES input polarity	Type	
	Standard	Optional
⏏	68 series	80 series
⏏	80 series	68 series

⏏ is set to the 68 series and ⏏ to the 80 series as the standard RES input polarities.

7. Pad Layout Specifications of COMS1 Symbol Terminal

On SED1220, pad layout of COMS1 symbol terminal can be changed. COMS1 pad layout can be selected on your request.

	Standard	Optional
Pad No	Pad Name	Pad Name
65	COMS1	COM1
66	COM1	COM2
67	COM2	COM3
68	COM3	COM4
69	COM4	COM5
70	COM5	COM6
71	COM6	COM7
72	COM7	COM8
73	COM8	COMS1

OUTLINE

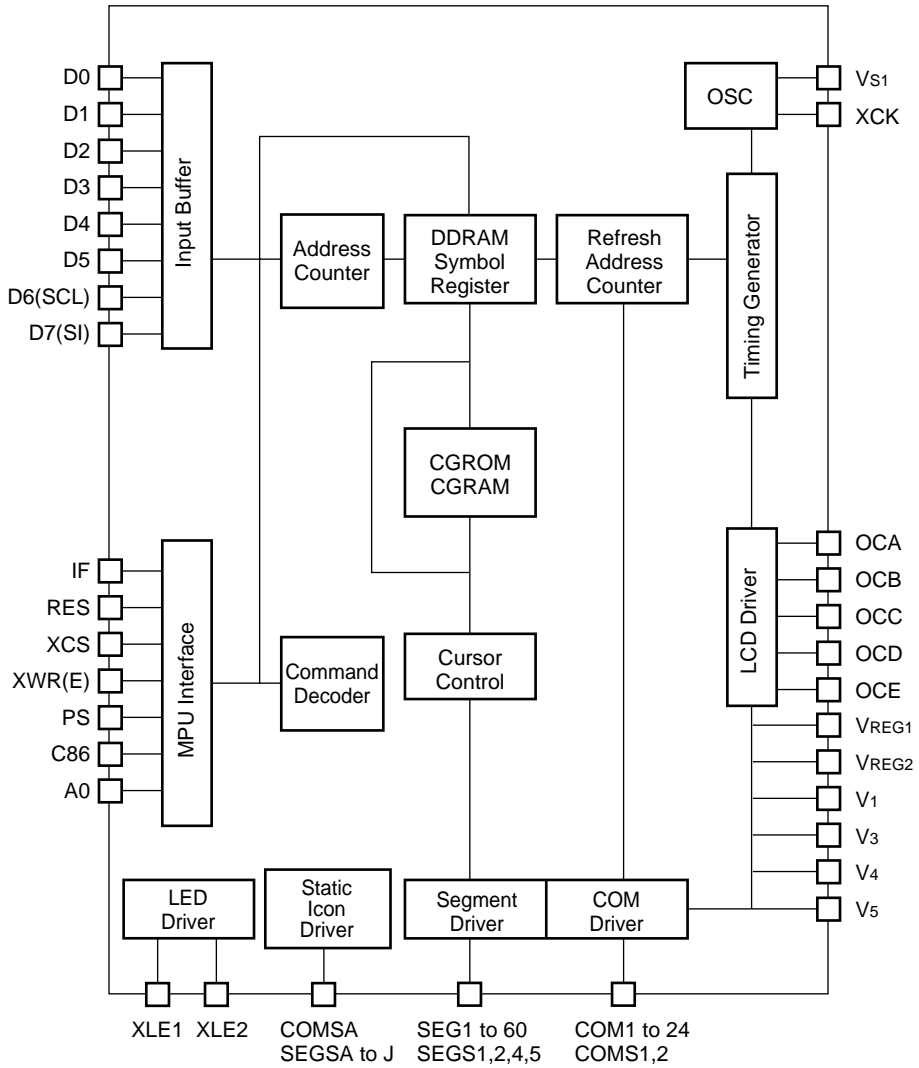

The SED1225 dot-matrix LCD Controller Driver receives 4-bit, 8-bit, or serial data from the microprocessor and displays up to 36 characters, four user-defined characters, and up to 120 symbols.

Up to 256 types of built-in character generator ROMs are provided. Each character font has a 5×8-dot structure. Also, the user-defined character RAM contains four 5×8-dot characters. In addition, a symbolic register can be used for flexible symbol display. The Driver featuring the very low power consumption can drive a handy terminal unit in either Sleep or Standby mode with the minimum power consumption.

FEATURES

- Built-in display data RAM
Can display up to 36 characters, 4 user-defined characters, and 120 symbols.
- Built-in CGROM (for 256-character display), CGRAM (for 4-character display), and symbol register (for 120 symbol display)
- No. of display columns by lines
Normal mode: (12 columns plus 4 signal segments) × 3 line + 120 symbols + 10 static symbols
Standby mode: 10 static symbols
- Built-in C&R oscillators
- Available external clock input
- High-speed MPU interfaces
Interface to both 68- and 80-series MPUs
Support of 4/8-bit interface
- Support of serial interface
- Character font: 5×8 dots
- Duty ratio: 1/18, 1/26
- Simple command setup
- Built-in LCD drive power circuit: Power amp and regulator
- Built-in electronic controls
- Very low power consumption
30 μA (including the operating current of the built-in power supply during normal operation)
10 μA (Static icon display during Standby operation)
5 μA (Display off during Sleep operation)
- Power supplies
VDD – Vss: –1.7 to –3.6 V
VDD – V5: –3.0 to –6.0 V
- Wide operating temperature range: Ta=–30 to +85°C
- CMOS process
- Package design
Chip (with gold bump): SED1225D*B
TCP: SED1225T**
- This IC package is not designed to have a radiation or strong light resistance.

SED1225 Series

PIN DESCRIPTION

Power Supply Pins

Pin Name	I/O	Description	No. of Pins
V _{DD}	Power supply	Connects to the logic power supply. This is common to the V _{CC} power pin of the MPU.	1
V _{SS}	Power supply	0V power pin connected to system ground (GND)	2
V ₁ , V ₃ V ₄ , V ₅	Power supply	Multi-level LCD drive power supplies. A capacitor is required for external stabilization.	4
V _{S1}	O	Output pin of oscillator (OSC) power voltage. A capacitor is required for stabilization.	1

Notes: Two V_{SS} pins are provided. As they are commonly connected inside the IC, an input into any V_{SS} can be used if power impedance is low. To have the enough noise resistance, however, the V_{SS} power input from each pin is recommended.

LCD Power Pins

Pin Name	I/O	Description	No. of Pins
V _{REG2}	O	Output pins of LCD voltage and amp source power supplies. A capacitor is required for stabilization.	1
OCA OCB OCC OCD OCE	O	A voltage capacitor pin. A capacitor is required for amplification.	5

LED Drive Terminal

Pin Name	I/O	Description	No. of Pins
XLE1 XLE2	O	An Nch open drain output terminal to drive the LED. Connects to the LED cathode.	2

System Bus Connector Pins

Pin Name	I/O	Description	No. of Pins																																																																		
D7(SI) D6(SCL) D5 to D0	I	<p>An 8-bit input data bus to be connected to the standard 8- or 16-bit MPU data bus. SED1225 Series

LCD Driver Signals

Dynamic drive pins

Pin Name	I/O	Description	No. of Pins
COM1 to COM24	O	Common signal output pins (for character display)	24
COMS1, COMS2	O	Common signal output pins (for non-character display) COMS1, COMS2: Common outputs for symbol display	3
SEG1 to SEG60	O	Segment signal output pins (for character display)	60
SEGS1, 2, 4, 5	O	Segment signal output pins (for non-character display) SEGS1, 2, 4, 5: Segment outputs for signal output	4

Note: As the same COMS1 signal is output at two pins, one of them must be used.

Static drive pins

Pin Name	I/O	Description	No. of Pins
COMSA	O	Common signal output pin (for icon display)	1
SEGSA, B, C, D, E, F, G, H, I, J	O	Segment signal output pin (for icon display)	10

Notes: We recommend to separate LCD panel electrodes of static drive pins from those of dynamic drive pins. If these patterns are closely located, the LCD and its electrodes may be deteriorated.

FUNCTION DESCRIPTION

MPU Interfaces

Interface type selection

Table 1

PS	Type	XCS	A0	XWR	SI	SCL	D0 to D7
H	Parallel input	XCS	A0	XWR	–	–	D0 to D7
L	Serial input	XCS	A0	H, L	SI	SCL	–

The SED1225 has the C86 pin for MPU selection. If the parallel input is selected (PS=high), it can be connected directly to the 80-series or 68-series MPU by setting the

The SED1225 can transfer data via the 4- or 8-bit data bus or via the serial data input (SI). The parallel or serial data input can be selected by setting the PS pin to high or low (see Table 1).

C86 pin to high or low (see Table 2). Also, the 8-bit or 4-bit data bus can be selected by the IF pin signal.

Table 2

C86 pin signal	Type	A0	XWR	XCS	D0 to D7
"L"	80 series	A0	XWR	XCS	D0 to D7
"H"	68 series	A0	E	XCS	D0 to D7

Interface to 4-bit MPU

If the 4-bit interface is selected (IF=low), the 8-bit command and data, and its address are transferred in two times.

Note: During continuous writing, the write time greater than the system cycle time (tcyc) must be set before the subsequent write operation.

Serial interface

The serial interface consists of an 8-bit shift register and a 3-bit counter. During chip select (XCS=low), an SI input and an SCL input can be accepted. During no chip select (XCS=high), the shift register and counter is initialized (reset).

Serial data of D7 to D0 are fetched in this order from the serial data input pin (SI) at the rising edge of serial clock. The data is converted into 8-bit parallel data at the rising edge of the eighth serial clock.

The serial data input (SI) is identified to have the display data or command by the A0 input. It is display data if A0=high, and it is command if A0=low.

The A0 input is fetched and identified at the rising edge of "8 × n-th" serial clock (SCL). Figure 1 shows a serial interface timing chart.

The SCL signals must be well protected from the far-end reflection and ambient noise due to increased line length. The operation checkout on the actual machine is recommended.

Also, we recommend to repeat periodical command writing and status refreshing to avoid a malfunction due to noise.

Figure 1

Data bus signal identification

The SED1225 identifies the data bus based on a combination of A0, AWR and E signals as defined on Table 3.

Table 3

Common	68 Series	80 Series	Function
A0	E	XWR	
1	1	0	Writes in the RAM and symbol register.
0	1	0	Writes (commands) in the internal register.

Chip Select

The SED1225 has an Chip Select pin (XCS) to allow an MPU interface input only if XCS=low. During no chip select status, all of D0 to D7, A0, XWR, SI and SCL inputs are made invalid. If the serial input interface is selected, the shift register and counter are reset. However, the Reset signal is entered independent from the XCS status.

Power Circuit

The built-in power circuit featuring the low power

consumption generates the required LCD drive voltages. The power circuit consists of an amp and a voltage regulator.

Amp

When the capacitors are connected to the OCA, OCB, OCC, OCD, OCE, VREG2 pins, the LCD drive voltages are generated. As the amp uses the signals from the oscillator, the oscillator or an external clock must be operating. The following provides the potential relationship.

Voltage regulator

- Voltage regulator using the electronic control function
Use the electronic control function and set the voltages appropriate to the LCD panel driving.
When a 5-bit data is set in the electronic control register, one of 32-state voltages can be set for LCD driving. Before using the electronic control function, turn ON the power circuit by issuing the power control command.
The following explains how to calculate the voltages using the electronic control function.

$$V_5 = 4 \times V_{EV}$$

Conditions:

$$V_{EV} = V_{REG2} - X$$

where,

$$X = n\alpha \quad (n=0, 1, \dots, 31)$$

$$\alpha = V_{REG2}/95$$

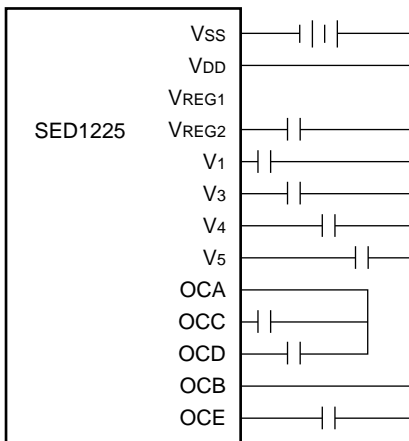

No.	Electronic control register	X	V ₅
0	(0, 0, 0, 0, 0)	0	Large
1	(0, 0, 0, 0, 1)	1α	•
2	(0, 0, 0, 1, 0)	2α	•
3	(0, 0, 0, 1, 1)	3α	•
•	•	•	•
•	•	•	•
30	(1, 1, 1, 1, 0)	n-1α	•
31	(1, 1, 1, 1, 1)	nα	Small

This is reference voltage for the liquid crystal drive power circuit. The VREGZ has a temperature characteristics of about -0.05%/deg.

External unit connection examples

An external voltage regulation capacitor must be connected to the LCD power pin. The LCD drive voltages are fixed to 1/4 biasing.

1/4 bias example

Note: We recommend to display the capacitance appropriate to the LCD panel size and set up the capacitance by observing the drive signal waveforms.

Reference set value: (0.1~1.0 μF)

Power Save mode

The SED1225 supports the Standby and Sleep modes to save the power consumption during system idling.

- Standby mode
The Standby mode is selected or released by the Power Save command. During Standby mode, only the static icon is displayed.
 1. LCD display outputs
COM1 to COM16, COMS1, COMS2:
VDD level
SEG1 to SEG60, SEGS1, 2, 4, 5:
VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA:
Can light by static drive
Use the Static Icon RAM to display the static icon with SEGSA, B, C, D, E, F, G, H, I, J and COMSA.
 2. DDRAM, CGRAM and symbol register
Their write contents do not change. The contents are kept regardless of Standby mode selection or release.
 3. The operation mode before selection of Standby mode is kept.
The internal circuits for dynamic display are stopped.
 4. Oscillator
The oscillator must be turned ON for static display.
- Sleep mode
To select the Sleep mode, turn OFF the power circuit and oscillator by issuing the command, and clear all data of Static Icon register to zero. Then, issue the Power Save command. The system power consumption will be minimized to almost the stopped status.
 1. LCD display outputs
COM1 to COM16, COMS1, COMS2:
VDD level
SEG1 to SEG60, SEGS1, 2, 4, 5:
VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA:
Clear all data of Static Icon register to zero.
 2. DDRAM, CGRAM and symbol register
Their write contents do not change. The contents are kept regardless of Standby mode selection or release.
 3. The operation mode before selection of Standby mode is kept.
All internal circuits are stopped.
 4. Oscillator
Turn OFF the built-in power supply and oscillator by issuing the Power Save and power control commands.

Reset Circuit

When the RES input is made active, this LSI is initialized.

- Initialization status

- (1) Display ON/OFF control

- C=0: Cursor off
- B=0: Blink off
- DC=0: Normal display
- D=0: Display off

- (2) Power save

- O=0: Oscillating circuit off
- PS=0: Power save off

- (3) Power control

- P=0: Power circuit off

- (4) System set

- N=0: 3 lines
- S2, S1=0: Direction of normal display
- CG=0: CGRAM unused

- (5) Electronic control

- Address: 28H
- Data: (0,0,0,0,0)

- (6) Static icon

- Address: 20H to 23H
- Data: (0,0,0,0,0)

- (7) LED register

- Address: 2AH
- Data: (0,0,0,0,0)

- (8) CG RAM, DD RAM and symbol register

- Address: 00H to 1FH, 30H to 7CH
- Data: Must be initialized by MPU after reset input because of being indefinite.

Connect the RES terminal to the MPU reset terminal as described in “6-1 MPU Interface”, and execute initialization simultaneously with the MPU. However, if the MPU bus and port are put into high impedance for a certain time period by resetting, perform reset input to the SED1225 after the input to the SED1225 has been determined. When the RES terminal becomes “L”, each register is cleared and the above setup is established. If initialization by the RES terminal is not performed when power voltage is applied, resetting may be disabled.

COMMAND

Table 4 lists the supported commands. The SED1225 identifies a data bus by a combination of A0, XWR and E signals. It features high-speed processing as the

commands are analyzed and executed in the internal timing only.

- Command outline

Table 4

Command type	Command name	A0	XWR
Display control instruction	Cursor Home	0	0
	Display On/Off Control	0	0
Power control	Power Save	0	0
	Power Control	0	0
System setup	System Setup	0	0
Address control instruction	Address Setup	0	0
Data input instruction	Data Write	1	0

As the execution time of each instruction depends on the internal processing time of the SED1225, an enough time greater than the system cycle time (tcyc) must be assigned for continuous instruction execution.

- Explanation of commands

(1) Cursor Home

The Cursor Home command presets the Address counter to 30H, and shifts the cursor to column 1 of line 1 if Cursor Display is ON.

(2) Display On/Off Control

The Display On/Off Control command sets the LCD character and cursor display.

- D=0: Turns the display off.
- D=1: Turns the display on.
- DC=0: Selects the standard size display.
- DC=1: Selects the double-height vertical display.
- B=0: Turns cursor blinking off.
- B=1: Turns cursor blinking on.

During blinking, the cursor character is alternately displayed normally and reversely. The normal and reverse display is repeated approximately every one second.

- C=0: Does not display the cursor.
- C=1: Displays the cursor.

The following provides the relationship between the C and B registers and cursor display.

C	B	Cursor display
0	0	Not displayed
0	1	Not displayed
1	0	Underbar cursor
1	1	Alternate character display normally and reversely

The cursor display position is indicated by the address counter. Accordingly, to move the cursor, change the address counter value by automatic increment by writing the RAM address set command or RAM data.

The following shows the relationship between the DC resistor and display:

(1) N=0 (1/26 duty)

The character on the 3rd line will be displayed in double size on the second and third lines by setting DC=1.

(2) N=1 (1/18 duty)

The character on the 1st line will be displayed in double size on the first and second lines by setting DC=1.

(3) Power Save

The Power Save command controls the oscillator and sets or releases the Sleep mode.

- PS=0: Turns the Power Save on. (Release)
- PS=1: Turns the Power Save off. (Select)
- O=0: Turn the oscillator off. (Stop oscillation)
- O=1: Turns the oscillator on. (Oscillation)

(4) Power Control

The Power Control command controls the built-in power circuit operations.

- P=0: Turns the power circuit off.
- P=1: Turns the power circuit on.
- Note: The oscillator must be operating to operate the voltage amp.

(5) System Reset

The System Reset command sets the display direction, the display line, and the use or no use of CGRAM. This command must first be executed after the power-on or reset.

- N=0: Displays 3 lines. (1/26 duty)
- N=1: Displays 2 lines. (1/18 duty)
- S2=0: Normal display
- S2=1: Right and left reverse display
- S1=0: Normal display
- S1=1: Top and bottom reverse display
- CG=0: Does not use the CGRAM.
- CG=1: Uses the CGRAM.

(1) Normal display

(2) Horizontal flipping

(3) Vertical flipping

(4) Horizontal vertical flipping

(6) RAM Address Setup

The RAM Address Setup command sets an address into the Address counter to write data into DDRAM, CGRAM and Symbol register. When the cursor display is ON, the cursor is located at a position corresponding to the DDRAM address set by this command.

* : Don't Care

- ① The 00H to 7FH address length can be set. To write data in the RAM, set the data write address by this command. When the subsequent data is written continuously, the address is automatically incremented.

RAM map

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
00H	CGRAM (00H)								CGRAM (01H)							
10H	CGRAM (02H)								CGRAM (03H)							
20H	SI1	SI2	Unused				EV	TEST	LED	Unused						
30H	DDRAM line 1								For signals				Unused			
40H	DDRAM line 2								For signals				Unused			
50H	DDRAM line 3								For signals				Unused			
60H	Symbol register								Symbol register				Unused			
70H	Symbol register								Symbol register				Unused			

SI : Static Icon register
 EV : Electronic Control register
 TEST : Test register
 (Do not use in normal operations.)

LED : LED register
 For signals : SEGs1, 2, 4, 5
 Symbol register : COMs1, COMs2

(7) Data Write

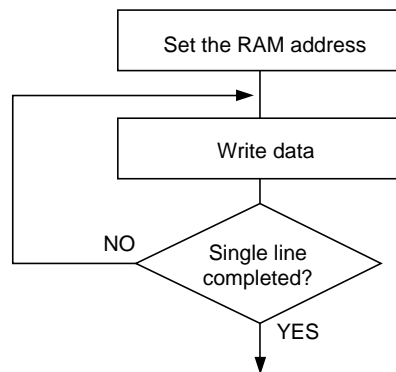

* : Don't Care

- ① This command writes data in the DDRAM, CGRAM or Symbol register.
- ② When this command is executed, the Address counter is incremented by 1 automatically. This allows continuous data writing.

Data write example:

The following gives an example to write a single line of data continuously.

Note: Assign an enough time greater than "t_{cy}" before executing the next instruction.

Table 4 SED1225 command list

Command	Code										Function	
	A0	XWR	D7	D6	D5	D4	D3	D2	D1	D0		
(1) Cursor Home	0	0	0	0	0	1	*	*	*	*	Shifts the cursor to its home position.	
(2) Display On/Off Control	0	0	0	0	1	1	C	B	DC	D	Turns on or off the cursor, cursor blinking, double-size display, and data display. C=1: Cursor ON; C=0: Cursor OFF B=1: Blinking ON; B=0: Blinking OFF DC=1: Double-size display; DC=0: Normal display D=1: Display ON; D=0: Display OFF	
(3) Power Save	0	0	0	1	0	0	*	*	0	PS	Turns on or off the Power Save mode and oscillator. PS=1: Power Save ON; PS=0: Power Save OFF O=1: OSC ON; O=0: OSC OFF	
(4) Power Control	0	0	0	1	0	1	0	0	0	P	Turns on or off the built-in power circuit and voltage follower capacity, and sets the amp frequency. P=1: Power circuit ON; P=0: Power circuit OFF	
(5) System Reset	0	0	0	1	1	0	N	S2	S1	CG	Sets the use or no use of CGRAM and the display direction. N=1: 3-line display; N=0: 2-line display CG=1: Use of CGRAM; CG=0: No use of CGRAM S2=0, S1=0: Normal display S2=0, S1=1: Top and bottom reverse display S2=1, S1=0: Right and left reverse display S2=1, S1=1: 180-degree rotation display	
(6) RAM Address Setup	0	0	1	ADDRESS							Sets an address of DDRAM, CGRAM or Symbol register.	
(7) RAM Write	1	0	DATA							Writes data in the DDRAM, CGRAM or Symbol register.		
(8) NOP	0	0	0	0	0	0	0	0	0	0	This is a non-operation command.	
(9) Test Mode	0	0	0	0	0	0	*	*	*	*	This is an IC chip test command. Do not use in normal operations.	

BUILT-IN MEMORIES

Character Generator ROM (CGROM)

The SED1225 contains up to 126 types of CGROMs. Each character has a 5×8-dot structure. Tables 5 to 8 defines the SED1225D** character codes. Four characters (00H to 03H) of character codes are used for the CGROM or CGRAM by the System Setup command.

The SED1225's CGROM is a mask ROM and it can be used as a custom CGROM. Consult to our sales agency for details.

The CGROM versions are identified as follows:

Example: SED1225D⁰B

↑

Character Generator RAM (CGRAM)

The SED1225 has a built-in CGRAM to program user-defined character patterns for highly flexible signal and character display.

Issue the System Setup command to use the CGRAM. The CGRAM has the 160-bit storage capacity, and it can

store up to four 5×8-dot character patterns.

The following provides the relationship between CGRAM character patterns and CGRAM addresses and character codes.

Character Code	RAM Address	CGRAM Data								Character Display	Signal Display	
		D7							D0	SEG	SEGS	
00H	00H to 07H	0	*	*	*	0	1	1	1	1		
		1	*	*	*	1	0	0	0	0		
		2	*	*	*	1	0	0	0	0		
		3	*	*	*	0	1	1	1	1		
		4	*	*	*	0	0	0	0	1		
		5	*	*	*	0	0	0	0	1		
		6	*	*	*	1	1	1	1	0		
		7	*	*	*	0	0	0	0	0		
01H	08H to 0FH	8	*	*	*	0	0	1	0	0		
		9	*	*	*	0	0	1	0	0		
		A	*	*	*	0	1	1	1	0		
		B	*	*	*	0	1	1	1	0		
		C	*	*	*	0	1	1	1	0		
		D	*	*	*	1	1	1	1	1		
		E	*	*	*	1	1	1	1	1		
F	*	*	*	0	0	0	0	0				

D7 to D5: Un used

D4 to D0: Character data (1 for display; 0 for no display)

The 5×8-dot character size can also be set. To do so, use the *7H and *FH RAM addresses. However, the *7H and *FH data is reversed if the underbar cursor is used.

Symbol Register

The SED1225 has a built-in Symbol register to allow separate symbol setup on the display panel. The Symbol register has the 120-bit storage capacity, and it can display 120 symbols. Also, the SED1225 contains a Blink register for every 5-dot blinking.

The following provides the relationship between the Symbol register display patterns, RAM addresses and write data.

RAM Address		Corresponding symbol bits							
		D7	D6	D5	D4	D3	D2	D1	D0
60H to 6BH	0	*	*	BL1	1	2	3	4	5
	1	*	*	BL2	6	7	8	9	10
	:	:							
	B	*	*	BL12	56	57	58	59	60
70H to 7BH	0	*	*	BL13	61	62	63	64	65
	1	*	*	BL14	66	67	68	69	70
	:	:							
	B	*	*	BL24	116	117	118	119	120

BL1 to BL24: Blinking setup (0 for no blinking; 1 for blinking)

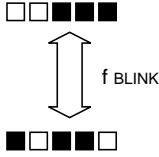

Note: If the symbol size is 1.5 times greater than other dots, we recommend to divide and drive the SEG* and COMS1 and COMS2 separately.

Static Icon RAM

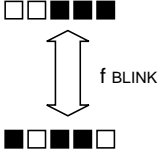

The SED1225 has a built-in Static Icon RAM to display a static icon separately from the dynamic icon. The Static Icon RAM has the 20-bit storage capacity, and

it can display 10 icons. The following provides the relationship between the static icon functions and the static icon, RAM address and write data.

(SEGS A, B, C, D, E)

Function	RAM Address	Static Icon Data								Display
		D7 ————— D0								
Display ON/OFF	20H	*	*	*	0	0	1	1	1	SEGSA B C D E 
Blink ON/OFF	21H	*	*	*	1	0	0	0	1	

(SEGS F, G, H, I, J)

Function	RAM Address	Static Icon Data								Display
		D7 ————— D0

- 1 : Display or blinking
- 0 : No display or no blinking
- f_{BLINK} : 1 to 2Hz

Electronic Control RAM (Register)

The SED1225 has the electronic control functions to control LCD drive voltages and to adjust the LCD display density. One of 32-state LCD voltages can be selected when the 5-bit data is written in the Electronic

Control RAM.

The following provides the relationship between the RAM address and write data by electronic control setup.

Function	RAM Address	Electronic Control Data								Status	VEV	
		D7 ————— D0										
Electronic Control	28H	*	*	*	0	0	0	0	0	0	0	VREG-0
		*	*	*	0	0	0	0	1	1	1	VREG- α
		*	*	*	0	0	0	1	0	2	2	VREG-2 α
		⋮								⋮	⋮	
		⋮								⋮	⋮	
		⋮								⋮	⋮	
		⋮								⋮	⋮	
	*	*	*	1	1	1	0	1	29	29	VREG-29 α	
*	*	*	1	1	1	1	0	30	30	VREG-30 α		
*	*	*	1	1	1	1	1	31	31	VREG-31 α		
	29H	*	*	*	*	*					For test	

* : Unused

α : α =VREG/95 (1/4biased)

Note: Do not use address 29H as it can be used for IC chip test only.

LED RAM (Register)

The SED1225 has the LED drive functions to drive the LCD by controlling the XLE1 and XLE2 pins.

The following provides the relationship between the RAM address and write data by LED register setup.

Function	RAM Address	LED Register Data							
		D7		D3		D2	D1	D0	
LED ON/OFF Timer	2AH	*	*	*	*	TIM2	TIM1	LED2	LED1

* : Unused

The following defines the XLE1 and XLE2 pin state depending on the TIM1, TIM2, LED1 and LED2 set values.

LED Register Set Value		Output Status (XLE1, XLE2)
TIM2 TIM1	LED2 LED1	
0	0	XLE = High impedance
0	1	XLE = Low
1	0	Keeps XLE low approximately 15 sec after input of Display ON command.
1	1	XLE = Low

Note: When this function is used, minimize power supply and power cable impedance to avoid IC misoperation due to large current.

MAXIMUM ABSOLUTE RATINGS

Item	Symbol	Rating	Unit
Power voltage (1)	V _{SS}	-0.6 to +0.3	V
Power voltage (2)	V ₅	-7.0 to +0.3	V
Power voltage (3)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ to +0.3	V
Input voltage	V _{IN}	V _{SS} -0.3 to +0.3	V
Output voltage	V _O	V _{SS} -0.3 to +0.3	V
Operating temperature	T _{opr}	-30 to +85	°C
Storage temperature	TCP	T _{str}	°C
	Bare chip		

- Notes:
1. All voltages are referenced to V_{DD}=0 V.
 2. The following voltage levels must always be satisfied:
V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄, and V_{DD} ≥ V_{SS} ≥ V₅
 3. If the LSI is used beyond the maximum absolute rating, the LSI may be destroyed permanently. The LSI should meet the electric characteristics during normal operations. If not, the LSI may be malfunction or the LSI reliability may be lost.

DC CHARACTERISTICS

(V_{SS} = -3.6 to -1.7 V, T_a = -30 to +85°C unless otherwise noted.)

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	Pin	
Power voltage (1)	Operable	V _{SS}	1/4 bias	-3.6	-3.0	-1.7	V	V _{SS}
			1/5 bias	-3.6	-3.0	-2.7		
	Data hold voltage		-3.6		-1.5			
Power voltage (2)	Operable	V ₅			-6.0	-3.0	V	V ₅
	Operable	V ₁ , V ₂			0.5 × V ₅	V _{DD}	V	V ₁ , V ₂
	Operable	V ₃ , V ₄			V ₅	0.5 × V ₅	V	V ₃ , V ₄
"Hi" input voltage	V _{IHC}		0.2 × V _{SS}			V _{DD}	V	*2
"Lo" input voltage	V _{ILC}		V _{SS}			0.8 × V _{DD}	V	*2
Input leakage current	I _{LI}	V _{IN} = V _{DD} or V _{SS}				1.0	μA	*2
LCD driver ON resistance	R _{ON} (LCD)	T _a =25°C ΔV=0.1V V ₅ =-5.0V		10	20		kΩ	COM, SEG *3
LED driver ON resistance	R _{ON} (LED)	V _{SS} =-3.0V I _{OL} =10mA		100			Ω	XLE1, XLE2
Static current consumption	I _{DDQ}			0.1	5.0		μA	V _{DD}
Dynamic current consumption	I _{DD}	During display	V ₅ = -5V; No loading V _{SS} =-1.8V		20	30	μA	V _{DD} *4
		During display	V ₅ = -5V; No loading V _{SS} =-3.0V		30	45	μA	V _{DD} *4
		During standby	OSC On; PWR off No loading; V _{SS} =-3.0V		10	15	μA	V _{DD}
		During sleep	OSC Off; PWR off No loading; V _{SS} =-3.0V		0.1	5	μA	V _{DD}
		During access	f _{cy} =200KHz V _{SS} =-3.0V		150	300	μA	V _{DD} *5
Input pin capacity	C _{IN}	T _a =25°C, f=1MHz		8.0	10.0		pF	*3

Frame frequency	f _{FR}	T _a = 25°C, V _{SS} = -3.0V	70	100	130	Hz	*8
External clock frequency	f _{CK}			33.8		kHz	*8, *9

Reset time	t _R		1.0			μs	*6
Reset pulse width	t _{RW}		10			μs	*6
Reset start time	t _{RES}		50			ns	*7

Dynamic system:

Built-in power supply	Amp output voltage	V ₅	T _a = 25°C (during 1/4 bias)	4 × V _{REG2}			V	
	Reference voltage	V _{REG2}	T _a = 25°C (during 1/4 bias)	-1.55	-1.5	-1.45	V	

- *1 Although the wide operating character range is guaranteed, a quick and excessive voltage variation may not be guaranteed during access by the MPU. The low-voltage data hold characteristics are valid during Sleep mode. No access by the MPU is allowed during this time.
- *2 D0 to D5, D6 (SCL), D7 (SI), A0, RES, XCS, XWR (E), PS, IF, C86
- *3 The resistance if a 0.1-volt voltage is supplied between the SEGn, SEGSn, COMn or COMSn output pin and each power pin (V1, V2, V3 or V4). It is defined within power voltage (2).
 $R_{ON} = 0.1V/\Delta I$
 where, ΔI is current that flows when the 0.1-volt voltage is supplied between the power supply and output.
- *4 Applied if not accessed by the MPU during character display and if the built-in power circuit and oscillator are operating.

Display character:

- *5 Current consumption is always written in "fcyc". The current consumption during access is roughly proportional to the access frequency (fcyc).
- *6 The "tr" (reset time) indicates a time period from the rising edge of RES signal to the completion of internal circuit reset. Therefore, the SED1225 enters the normal operation status after "tr".
- *7 Defines the minimum pulse width of RES signal. A pulse width greater than "trw" must be entered for reset.

All signal timings are based on 20% and 80% of Vss.

- *8 The following provides the relationship between the oscillator frequency (fOSC) for built-in circuit driving and the frame frequency (fFR).
 $f_{OSC} = 13 \times 26 \times f_{FR}$ (3-line display)
 $= 13 \times 18 \times f_{FR}$ (2-line display)
 <Reference>
 $f_{BLK} = (1/128) \times f_{FR}$
- *9 Enter the waveforms in 40% to 60% duty to use an external clock instead of the built-in oscillator. If no external clock is entered, fix it to high. (Normal high)

SIGNAL TIMING CHARACTERISTICS

(1) MPU bus write timing (80 series)

(Ta = -30 to +85°C, Vss = -3.6V to -1.7V)

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
Address setup time	A0	t _{AW8}	All timing must be based on 20% and 80% of V _{ss} .	60	—	ns
Address hold time	XCS	t _{AH8}		30	—	
XCS setup time	XCS	t _{AC8}		0	—	
System cycle time		t _{CYC8}		1850	—	ns
Write "Lo" pulse width (XWR)	XWR	t _{CCL}		150	—	ns
Write "Hi" pulse width (XWR)	XWR	t _{CCH}		1650	—	ns
Data setup time	D0 to D7	t _{DS8}		50	—	ns
Data hold time	D0 to D7	t _{DH8}		50	—	

(Ta = -30 to +85°C, Vss = -3.3V to -2.7V)

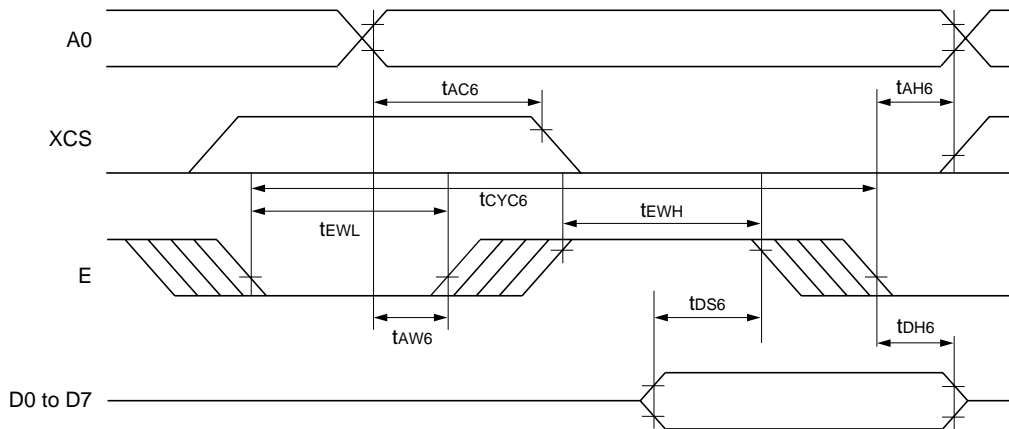

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
Address setup time	A0	t _{AW8}	All timing must be based on 20% and 80% of V _{ss} .	60	—	ns
Address hold time	XCS	t _{AH8}		30	—	
XCS setup time	XCS	t _{AC8}		0	—	
System cycle time		t _{CYC8}		1150	—	ns
Write "Lo" pulse width (XWR)	XWR	t _{CCL}		100	—	ns
Write "Hi" pulse width (XWR)	XWR	t _{CCH}		1000	—	ns
Data setup time	D0 to D7	t _{DS8}		20	—	ns
Data hold time	D0 to D7	t _{DH8}		20	—	

*1 The input signal rise and fall times (tr, tf) are defined to be 25 nsec max (except for RES input).

*2 "t_{CCL}" is defined by the overlap time of XCS low level and XWR low level.

(2) MPU bus write timing (68 series)

($T_a = -30$ to $+85^\circ\text{C}$, $V_{SS} = -3.6\text{V}$ to -1.7V)

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
Address setup time	A0	t_{AW6}	All timing must be based on 20% and 80% of V_{SS} .	60	—	ns
Address hold time	XCS	t_{AH6}		50	—	
XCS setup time	XCS	t_{AC6}		0	—	
System cycle time		t_{CYC6}		1850	—	ns
Enable "Lo" pulse width (XWR)	XWR	t_{EWL}		1650	—	ns
Enable "Hi" pulse width (XWR)	XWR	t_{EWH}	150	—	ns	
Data setup time	D0 to D7	t_{DS6}		20	—	ns
Data hold time	D0 to D7	t_{DH6}		80	—	

($T_a = -30$ to $+85^\circ\text{C}$, $V_{SS} = -3.3\text{V}$ to -2.7V)

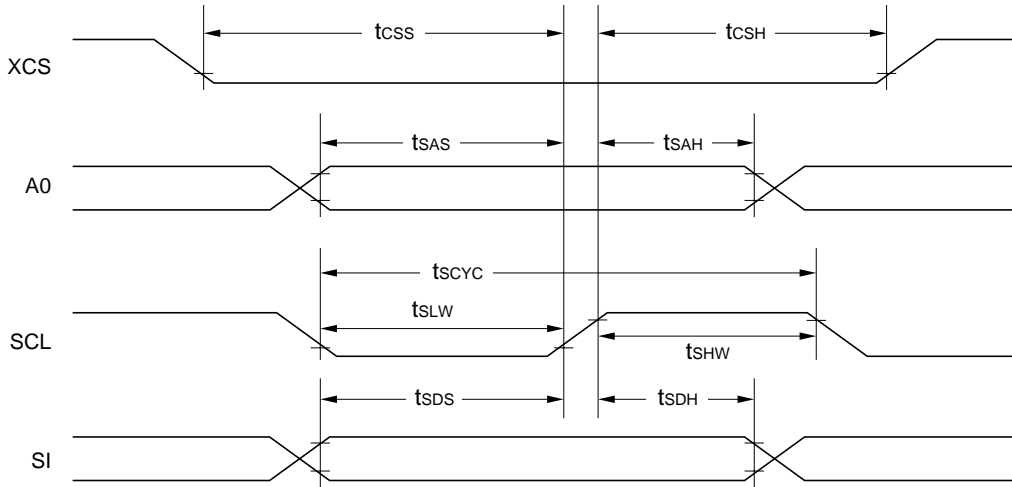

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
Address setup time	A0	t_{AW6}	All timing must be based on 20% and 80% of V_{SS} .	60	—	ns
Address hold time	XCS	t_{AH6}		30	—	
XCS setup time	XCS	t_{AC6}		0	—	
System cycle time		t_{CYC6}		1150	—	ns
Enable "Lo" pulse width (XWR)	XWR	t_{EWL}		1000	—	ns
Enable "Hi" pulse width (XWR)	XWR	t_{EWH}	100	—	ns	
Data setup time	D0 to D7	t_{DS6}		20	—	ns
Data hold time	D0 to D7	t_{DH6}		50	—	

*1 The input signal rise and fall times (t_r , t_f) are defined to be 25 nsec max (except for RES input).

*2 " t_{EWH} " is defined by the overlap time of XCS low level and XWR low level.

(3) Serial interface

($T_a = -30$ to $+85^\circ\text{C}$, $V_{SS} = -3.6\text{V}$ to -1.7V)

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
System clock cycle	SCL	t_{SCYC}	All timing must be based on 20% and 80% of V_{SS} .	3000	—	ns
SCL "Hi" pulse width		t_{SHW}		2850	—	
SCL "Lo" pulse width		t_{SLW}		150	—	
Address setup time	A0	t_{SAS}		50	—	ns
Address hold time		t_{SAH}		800	—	
Data setup time	SI	t_{SDS}		50	—	ns
Data hold time		t_{SDH}		50	—	
CS-to-SCL time	XCS	t_{CSS}		400	—	ns
		t_{CSH}		2500	—	

($T_a = -30$ to $+85^\circ\text{C}$, $V_{SS} = -3.3\text{V}$ to -2.7V)

Item	Signal	Symbol	Conditions	Min.	Max.	Unit
System clock cycle	SCL	t_{SCYC}	All timing must be based on 20% and 80% of V_{SS} .	1400	—	ns
SCL "Hi" pulse width		t_{SHW}		1300	—	
SCL "Lo" pulse width		t_{SLW}		50	—	
Address setup time	A0	t_{SAS}		50	—	ns
Address hold time		t_{SDH}		500	—	
Data setup time	SI	t_{SDS}		30	—	ns
Data hold time		t_{SDH}		30	—	
CS-to-SCL time	XCS	t_{CSS}		200	—	ns
		t_{CSH}		1500	—	

*1 The input signal rise and fall times (t_r , t_f) are defined to be 25 nsec max (except for RES input).

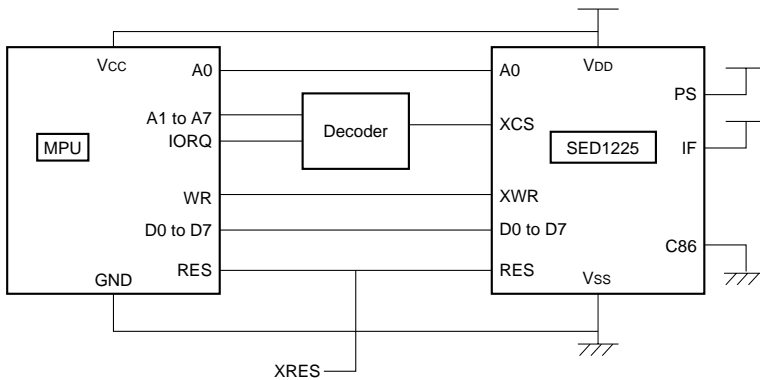

MPU INTERFACES (REFERENCE)

The SED1225 can be connected to the 80-series or 68-series MPU. Also, it can operate with a less number of signal lines via the serial interface.

If the MPU buses and ports are set to high impedance for

a certain time due to RESET, the RESET signal must be entered in the SED1225 after the SED1225's inputs have been determined.

80-Series MPU

SED1225 Series

LCD DRIVE WAVEFORMS (B WAVEFORMS)

EXAMPLE OF INSTRUCTION SETUP (REFERENCE)

Initialization

Sleep Mode

(1) Setting the Sleep mode.

(2) Clearing the sleep mode

Note 1. <6> and <7> of 15-1 indicate RAM initialization. Set the contents to be displayed in the beginning. For items not to be displayed (RAM Clear), use the following steps:

- DD RAM - write 20H (character code).
- CG RAM - write 00H (data '0').
- Symbol register - write 00H (data '0').

The RAM data is unspecified at the time of reset input (after power is turned on). If the data '0' is not written at this stage, unexpected display may occur to the unset position.

Note 2. Defined by the rising characteristics of the power circuit, time setting varies according to the external capacity. So be sure to make confirmation by external capacity, and set this time.

Note 3. The dynamic drive system display lamp is lit up by the display on/off command when it is on. The static icon lamp is lit by the static icon control command. So to light up the lamp simultaneously with start of display, execute the display on/off control command and static icon control within one frame.

OPTION LIST

The SED 1225 has the following options. Options are available exclusively for users. Please contact our Sales Department for information.

- The following shows how to define the name of the product compatible with options:

Example: SED1225D*B

↑
Option compatibility column

Specification of character generator ROM (CGROM)

The SED1225 incorporates a characters generator ROM consisting of up to 256 types of characters, with each character size featuring 5×7 (8) dots. The SED1225 CGROM is designed as a masked ROM, and is compatible with the CGROM for exclusive use of the user. For the standard CGROM, see the Character Font Table.

Specifications of external clock

The SED1225 has an external clock terminal which is provided with two types of functions; f_{OSC} and $4 \times f_{OSC}$. Either f_{OSC} or $4 \times f_{OSC}$ can be selected according to the user's requirements.

	Built-in oscillation f_{OSC}	External clock f_{OSC}	External clock $4 \times f_{OSC}$
Standard	○	○	×
Optional	○	×	○

The standard external clock specifications are set on the f_{OSC} .

CAUTIONS

The following points should be noted when this Development Specification is used:

1. This Development Specification is subject to modification for improvement without prior notice.
2. This Development Specification is not intended to guarantee enforcement of industrial property and other rights, or to grant license for the use of this product. Examples of applications mentioned in this Development Specification are given for effective understanding of the product. We are not responsible for any circuit problems which might occur due to use of these examples. The size of the values appearing in the characteristics table is represented by the size of the number line.
3. Part or whole of this Development Specification shall not be quoted, reproduced or used for other purposes without permission of our company.

For the use of the semi-conductor, take note of the following:

“Handling cautions for light”

According to the principle of the solar battery the semiconductor characteristics are changed when exposed to light. So misoperation may occur if this IC is exposed to light.

For the single IC unit, measures against light are not yet completely taken. The board and the product where this IC is mounted must be provided with the following measures:

- (1) For designing and mounting, measures must be taken to provide the structure which ensures the light protecting properties of the IC during actual use.
- (2) In the inspection process, environmental design must be made with consideration given to the light protecting properties of the IC.
- (3) To ensure light protecting properties of the IC, consideration must be given to the surface, back and sides of the IC chip.

OVERVIEW

The SED1230 Series is a dot matrix LCD controller driver for character display, and can display a maximum of 48 characters, 4 user-defined characters, and a maximum of 64 symbols by means of 4-bit, 8-bit or serial data sent from a microcomputer.

A built-in character generator ROM is prepared for 256 character types, and each character font consists of 5×7 dots. A user-defined character RAM for four characters of 5×7 dots are incorporated, and a symbol register is also incorporated. With these, it is possible to apply this Series to display with a high degree of freedom. This Series can operate handy units with a minimum power consumption by means of its low power consumption and standby mode.

The SED1230 Series are classified into SED1230, SED1231, SED1232, and SED1233 depending on the duty of use and the number of display columns.

FEATURES

- Built-in display RAM
48 characters + 4 user-defined characters + 64 symbols
- CG ROM (for up to 256 characters), CG RAM (4 characters), and symbol register (64 symbols)
- Number of display columns \times number of lines
(12 columns + 1 column for signal) \times 4 lines + 52 symbols: SED1230
(12 columns + 1 column for signal) \times 3 lines + 52 symbols: SED1231
(12 columns + 1 column for signal) \times 2 lines + 52 symbols: SED1232
16 columns \times 2 lines + 64 symbols: SED1233

- CR oscillation circuit (on-chip C and R)
- High-speed MPU interface
Interfacing with both 68 series and 80 series MPU
Interfacing in 4 bits/8 bits
- Serial interface
- Character font 5×7 dots
- Duty ratio
1/16 (SED1232, SED1233)
1/23 (SED1231)
1/30 (SED1230)
- Simple command setting
- Built-in liquid crystal driving power circuit
Power boosting circuit, power regulating circuit, voltage follower $\times 4$
- Built-in electronic volume function
- Low power consumption
100 μ A Max. (In normal operation mode:
Including the operating current of the built-in power supply)
20 μ A Max. (In standby display mode)
- Power supply
VDD - VSS (logic section): -2.4 V to -3.6 V
VDD - V5 (liquid crystal drive section)
: -5.0 V to -11.0 V
- Wide operating temperature range
Ta = -30 to 85° C
- CMOS process
- Delivery form: Chip SED123*D*B, SED123*D*E
(Gold bump product)
SED123*D*A, SED123*D*C
(A1 pad product)
TCP SED123*T**
- This IC is not designed with a protection against radioactive rays.

DESCRIPTION OF PINS

Power Pins

Pin name	I/O	Description	Q'ty
VDD	Power supply	Logic + power pin. Also used as MPU power pin Vcc.	2
VSS	Power supply	Logic – power pin. Connected to the system GND.	2
V0, V1 V2, V3 V4, V5	Power supply	Multi-level power supply for liquid crystal drive. The voltage determined in the liquid crystal cell is resistance-divided or impedance-converted by operational amplifier, and the resultant voltage is applied. The potential is determined on the basis of VDD and the following equation must be respected. $V_{DD} = V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$ $V_{DD} \geq V_{SS} \geq V_5 \geq V_{OUT}$ When the built-in power supply is ON, the following voltages are given to pins V1 to V4 by built-in power circuit: $V_1 = 1/5 V_5$ $V_2 = 2/5 V_5$ $V_3 = 3/5 V_5$ $V_4 = 4/5 V_5$	6
Vs1	O	Power supply voltage output pin for oscillating circuit. Don't connect this pin to an external load.	1

LCD Power Circuit Pins

Pin name	I/O	Description	Q'ty
CAP1+	O	Capacitor positive side connecting pin for boosting. This pin connects the capacitor with pin CAP1–.	1
CAP1–	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP+.	1
CAP2+	O	Capacitor positive side connecting pin for boosting. This pin connects a capacitor with pin CAP2–.	1
CAP2–	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP2+.	1
VOUT	O	Output pin for boosting. This pin connects a smoothing capacitor with Vss pin.	1
VR	I	Voltage regulating pin. This pin gives a voltage between VDD and V5 by resistance-division of voltage.	1

Pins for System Bus Connection

Pin name	I/O	Description	Q'ty																		
D7 (SI) D6 (SCL) D5 ~ D0	I	8-bit input data bus. These pins are connected to a 8-bit or 16-bit standard MPU data bus. When P/S = "Low", the D7 and D6 pins are operated as a serial data input and a serial clock input respectively. <table border="1" style="margin-left: 20px;"> <tr> <td>P/S</td> <td>D7</td> <td>D6</td> <td>D5 ~ D0</td> <td>\overline{CS}</td> <td>A0</td> </tr> <tr> <td>"Low"</td> <td>SI</td> <td>SCL</td> <td>—</td> <td>\overline{CS}</td> <td>A0</td> </tr> <tr> <td>"High"</td> <td>D7</td> <td>D6</td> <td>D5 ~ D0</td> <td>\overline{CS}</td> <td>A0</td> </tr> </table>	P/S	D7	D6	D5 ~ D0	\overline{CS}	A0	"Low"	SI	SCL	—	\overline{CS}	A0	"High"	D7	D6	D5 ~ D0	\overline{CS}	A0	8
P/S	D7	D6	D5 ~ D0	\overline{CS}	A0																
"Low"	SI	SCL	—	\overline{CS}	A0																
"High"	D7	D6	D5 ~ D0	\overline{CS}	A0																
A0	I	Usually, this pin connects the least significant bit of the MPU address bus and identifies a data command. 0 : Indicates that D0 to D7 are a command. 1 : Indicates that D0 to D7 are display data.	1																		
RES	I	In case of a 68 series MPU, initialization can be performed by changing RES $\square\downarrow$. In case of an 80 series MPU, initialization can be performed by changing $\square\uparrow$. A reset operation is performed by edge sensing of the RES signal. An interface type for the 68/80 series MPU is selected by input level after initialization. "L" : 68 series MPU interface "H" : 80 series MPU interface	1																		
\overline{CS}	I	Chip select signal. Usually, this pin inputs the signal obtained by decoding an address bus signal. At the "Low" level, this pin is enabled.	1																		
\overline{WR} (E)	I	<When connecting an 80 series MPU> Active "Low". This pin connects the \overline{WR} signal of the 80 series MPU. The signal on the data bus is fetched at the rise of the \overline{WR} signal. <When connecting a 68 series MPU> Active "High". This pin becomes an enable clock input of the 68 series MPU.	1																		
P/S	I	This pin switches between serial data input and parallel data input. <table border="1" style="margin-left: 20px;"> <tr> <td>P/S</td> <td>Chip Select</td> <td>Data/Command</td> <td>Data</td> <td>Serial Clock</td> </tr> <tr> <td>"High"</td> <td>\overline{CS}</td> <td>A0</td> <td>D0~D7</td> <td>—</td> </tr> <tr> <td>"Low"</td> <td>\overline{CS}</td> <td>A0</td> <td>SI</td> <td>SCL</td> </tr> </table>	P/S	Chip Select	Data/Command	Data	Serial Clock	"High"	\overline{CS}	A0	D0~D7	—	"Low"	\overline{CS}	A0	SI	SCL	1			
P/S	Chip Select	Data/Command	Data	Serial Clock																	
"High"	\overline{CS}	A0	D0~D7	—																	
"Low"	\overline{CS}	A0	SI	SCL																	
IF	I	Interface data length select pin for parallel data input. "High": 8-bit parallel input "Low": 4-bit parallel input When P/S = "Low", connect this pin to VDD or Vss.	1																		

SED1230 Series

Liquid Crystal Drive Circuit Signals

SED1230, SED1231, SED1232

Pin name	I/O	Description	Q'ty
COM1~ COM28	O	Common signal output pin (for characters)	28

SEGS1	O	Segment signal output pin (except for characters) SEGS1: Segment output for static drive. In the standby mode only, a Vss amplitude is output.	1

FUNCTIONAL DESCRIPTION

MPU Interface

Selection of interface type

In the SED1230 Series, data transfer is performed through a 8-bit or 4-bit data bus or a serial data input (SI). By selecting “High” or “Low” as P/S pin polarity, a parallel data input or a serial data input can be selected as shown in Table 1.

Table 1

P/S	Type	\overline{CS}	A0	\overline{WR}	SI	SCL	D0~D7
“High”	Parallel Input	\overline{CS}	A0	\overline{WR}	—	—	D0~D7
“Low”	Serial Input	\overline{CS}	A0	—	SI	SCL	—

Parallel Input

In the SED1230 Series, when parallel input is selected (P/S = “High”), it can be directly connected to the 80 series MPU bus or 68 series MPU bus, as shown in Table 2, if either “High” or “Low” is selected as RES pin polarity after a reset input, because the RES pin has an MPU select function.

Selection between 8 bits and 4 bits is performed by command.

Table 2

RES input polarity	Type	A0	\overline{WR}	\overline{CS}	D0~D7
$\square \downarrow$ active	68 series	A0	E	\overline{CS}	D0~D7
$\square \uparrow$ active	80 series	A0	\overline{WR}	\overline{CS}	D0~D7

Interface with 4-bit MPU interface

When data transfer is performed by 4-bit interface (IF = 0), an 8-bit command, data and address are divided into two parts.

Note: When performing writing in succession, reverse a time exceeding the system cycle time (t_{cyc}) and then perform writing.

Serial interface (P/S = “Low”)

The serial interface consists of a 8-bit shift register and a 3-bit counter and acceptance of an SI input or SCL input is enabled in the ship selected status (\overline{CS} = “Low”).

When no chip is selected, the shift register and counter are reset to the initial status.

Serial data is input in the order of D7, D6 ... D0 from the serial data input pin (SI) at the rise of Serial Clock (SCL).

At the rising edge of the 8th serial clock, the serial data is converted into 8-bit parallel data and this data is processed. The A0 input is used to identify whether the serial data input (SI) is display data or a command. That is, when A0 = “High”, it is regarded as display data. When A0 = “Low”, it is regarded as a command.

The A0 input is read in and identified at the rise of the 8 x n-th clock of Serial Clock (SCL) after chip selection.

Fig. 1 shows a timing chart of the serial interface.

Regarding the SCL signal, special care must be exercised about terminal reflection and external noise due to a wire length. We recommend the user to perform an operation check with a real machine.

We also recommend the user to periodically refresh the write status of each command to prevent a malfunction due to noise.

Fig. 1

Identification of data bus signals

The SED1230 series identifies data bus signals, as shown in Table 3, by combinations of A0 and \overline{WR} (E).

Table 3

Common	68 series	80 series	Function
A0	E	\overline{WR}	
1	1	0	Writing to RAM and symbol register
0	1	0	Writing to internal register (command)

Chip select

The SED1230 series has a chip select pin (\overline{CS}). Only when \overline{CS} = “Low”, MPU interfacing is enabled. In any status other than Chip Select, D0 to D7 and A0, \overline{WR} , SI and SCL inputs are invalidated. When a serial input interface is selected, the shift register and counter are reset.

However, the Reset signal is input regardless of the \overline{CS} status.

Power Circuit

This is a low-power-consumption power circuit that generates a voltage required for liquid crystal drive. The power circuit consists of a boosting circuit, voltage regulating circuit and voltage follower.

The power circuit incorporated in the SED1230 Series is set for a small-scale liquid crystal panel, so that its display quality may be greatly deteriorated if it is used for a liquid crystal panel with a large display capacity. In this case, an external power supply must be used.

A power circuit function can be selected by power control command. With this, an external power supply and a part of the internal power supply can be used together.

	Boosting circuit	Voltage regulating circuit	Voltage follower	External voltage input	Boosting system pin
	○	○	○	—	
Note 1	×	○	○	VOUT	OPEN
Note 2	×	×	○	V5 = VOUT	OPEN
Note 3	×	×	×	V1, V2, V3, V4, V5	OPEN

Note 1: When the boosting circuit is turned off, make boosting system pins (CAP1+, CAP1-, CAP2+, CAP2-) open and give a liquid crystal drive voltage to the VOUT pin from the outside.

Note 2: When the voltage regulating circuit is not used with the boosting circuit OFF, make the boosting system pins open, connect between the V5 pin and VOUT pin, and give a liquid crystal drive voltage from the outside.

Note 3: When all the internal power supplies are turned off, supply liquid crystal drive voltages V1, V2, V3, V4 and V5 from the outside, and make the CAP1+, CAP1-, CAP2+, CAP2- and VOUT pins open.

Triple boosting circuit

When a capacitor is connected between CAP1+ and CAP1-, between CAP2+ and CAP2-, and between VSS pin and VOUT pin respectively, the potential between the VDD pin and VSS pin is boosted triple and output to the VOUT pin. In case of double boosting, remove the capacitor between CAP2+ and CAP2- in connection for triple boosting operation and strap between CAP2- and

VOUT pin. Then, a double boosted output can be obtained from the VOUT pin (CAP2-).

The boosting circuit uses a signal from the oscillator output.

Accordingly, it is necessary that the oscillating circuit must be in operation. The potential relationship of boosting is shown below.

Potential during double boosting

Potential during triple boosting

Voltage regulating circuit

The voltage regulation circuit regulates the boosted voltage developed at Vout. It outputs the regulated LCD driving voltage at the V5 terminal. An internal resistor can be inserted into the regulation circuit feedback loop providing the following voltage levels at the V5 terminal.

The voltage regulator circuit carries a temperature gradient of about -0.17%/°C under VREG outputs (standard specification), about -0.04%/°C (option). When any other temperature gradient is required, connect a thermistor in series to the output voltage regulating register.

When V5 is required to be different than the above case, leave the internal feedback resistor out of the circuit. V5 can be regulated within a range of |V5|<|VOUT|. It may be calculated by the following formula:

Since the VR terminal has a high input impedance, it is necessary to take noise suppression measures such as shortening the input wiring and shielding the wiring run.

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) \cdot V_{REG} \quad \text{①}$$

Wherein, VREG is the constant voltage source inside the SED1230 Series and the voltage is constant at VREG ≈ 3.1V. The voltage regulation VREG ≈ 2.1V (TYP.) in option 1, and VREG = VSS in option 2. Voltage regulation of the V5 output is accomplished by connecting a variable resistor between VR, VDD and V5. For fine adjustment of the V5 voltage, use a combination of fixed resistors R1 and R3 and a variable resistor R2.

Example 1:

Condition: $I(R_1, R_2, R_3) \leq 5\mu A$ $V_5 = -6$ to $-8V$

$$\text{Setting: } \left. \begin{array}{l} R_1 + R_2 + R_3 = 8V / 5\mu A = 1.6M\Omega \\ 8V = (1 + R_b/R_a) \cdot 3.0V \quad R_b/R_a = 1.67 \\ 6V = (1 + R_b/R_a) \cdot 3.0V \quad R_b/R_a = 1 \end{array} \right\} \dots \left\{ \begin{array}{l} R_1 = 600K\Omega \\ R_2 = 200K\Omega \\ R_3 = 800K\Omega \end{array} \right.$$

● Voltage Regulation Circuit Using Electronic Contrast Control Register

The contrast control register controls the liquid crystal driving voltage (V5). This is accomplished by an electronic volume control register set command that adjusts the contrast of the liquid crystal display (see section 1-22).

The commands provide 4-bits of voltage level data to the electronic volume control register. This provides for the selection of 16 different voltage levels for the liquid crystal driving voltage. When using the electronic volume control function, it is necessary to close the voltage regulation circuit using electronic control commands. For reference information, when the electronic volume control register value is at (1, 1, 1, 1), the constant current value becomes: $I_{REF} \approx 3.65\mu A$.

[An exemplary constant setting when the electronic volume control function is being used]

$$V_5 = \left(1 + \frac{R_b}{R_c}\right) \cdot V_{REG} \dots\dots\dots ②$$

$$\therefore R_c = \frac{R_a \times R_I}{R_a + R_I}$$

$$R_I = \frac{V_R}{I_{REF}}$$

Fig. 9

- (1) Determining the V5 voltage setting range by the electronic volume control
Liquid crystal driving voltage V5: max. -6V ~ min. -8V
V5 variable voltage range: 2V

- (2) Determining the Rb
 $R_b = V_5 \text{ variable voltage range} / I_{REF}$ ($I_{REF} \approx 3.65\mu A$ Constant current)
 $= 2V / 3.65\mu A$
 $= 548K\Omega$

- (3) Determining the Ra
 $R_a = \frac{V_{REG}}{(V_5 \text{ voltage setting max} - V_{REG}) / R_b}$ (Use absolute values for VREG and V5 voltage settings.)
 $= \frac{3.1V}{(6V - 3.1V) / 548K\Omega}$
 $= 585K\Omega$

- (4) Regulating the Ra
Set the electronic volume control register to (D3, D2, D1, D0) = (1, 0, 0, 0) or (0, 1, 1, 1) before matching the Ra value to the optimum contrast.

Since IREF is a simplified constant voltage source, fluctuations upto $\pm 40\%$ must be taken into consideration, as a dispersion range during manufacture. Meanwhile, the temperature dependency of IREF is: $\Delta I_{REF} \approx -0.037\mu A / ^\circ C$. Determine the Ra and Rb for the using LCD panel in consideration of the above dispersion and the variation by the temperature.

When using the electronic volume control function, in order to compensate the V5 voltage for dispersion of VREG and IREF, use a variable resistor as Ra and perform optimum contrast adjustment according to the above item (4) with each IC chip.

When the electronic volume control function is not being used, set the electronic volume control register to (0, 0, 0, 0) using the RES signal or the electronic volume control register setting command.

Liquid crystal voltage generating circuit

The V5 potential is resistance-divided inside the IC so that V1, V2, V3 and V4 potentials are generated for liquid crystal drive.

Furthermore, the V1, V2, V3 and V4 are impedance-converted by voltage follower and the then supplied to

the liquid crystal drive circuit.

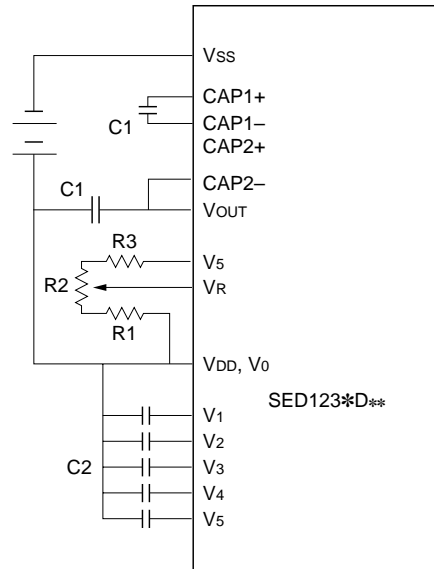

The liquid crystal drive voltage is fixed to 1/5 bias.

As shown in the diagrams below, the capacitor (C2) for voltage stabilization must be externally connected to the V1 to V5 pins of liquid crystal power pins.

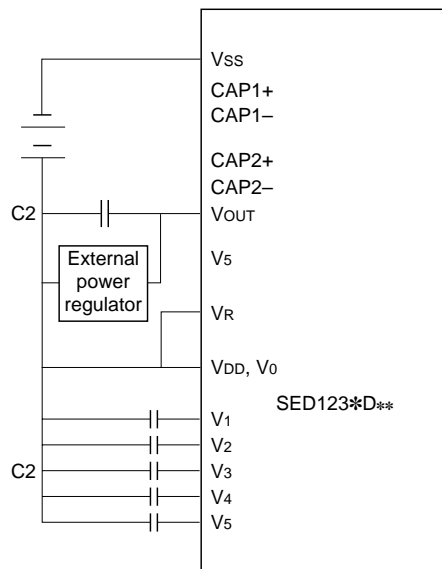

When a built-in power supply is used
Under a triple boosting

The diagram under a double boosting

When an external power regulator is used
(The built-in power regulator is not used)

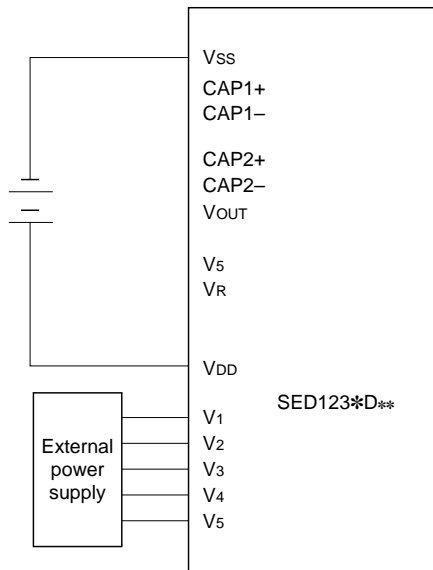

Reference setting values: C1: 0.1 - 4.7 μ F
C2: 0.1 μ F

We recommend the user to set the optimum values to capacitors C1 and C2 according to the panel size watching the liquid crystal display and drive waveforms.

SED1230 Series

When a built-in power supply is not used

Low Power Consumption Mode

The SED1230 Series is provided with the standby mode and sleep mode with the object of low power consumption when the unit is in the standby state.

© Standby Mode

The standby mode is turned on and off by power save command.

In the standby mode only, static display is enabled by CMOS1 and SEGS1.

1. Liquid crystal display output
 COM1 ~ COM28, COMS2, COMS3 : VDD level
 SEG1 ~ SEG60, SEGS2 ~ SEGS6 : VDD level
 COMS1, SEGS1 : Lighting is enabled by static drive.
 Perform display control using CMOS1 and SEGS1 by static display control command.
2. DD RAM, CG RAM and symbol register
 Written contents do not change and are stored regardless of whether the standby mode is turned on or off.
3. In the operation mode, the status precedent to execution of the standby mode is held.
 The internal circuit for dynamic display output stops.
4. Oscillating circuit
 For static display, the oscillating circuit must be ON.

© Sleep Mode

After the power circuit and oscillating circuit are turned off by command and the power save command is ex-

ecuted, the sleep mode is set. This mode permits reducing current consumption nearly to the static current value.

1. Liquid crystal display output
 COM1 ~ COM28, COMS2, COMS3 : VDD level
 SEG1 ~ SEG60, SEGS2 ~ SEGS6 : VDD level
 COMS1 ~ SEGS1 : VDD level
2. DD RAM, CG RAM and symbol register
 Written contents do not change and are stored regardless of whether the sleep mode is turned on or off.
3. In the operation mode, the status precedent to execution of the sleep mode is held. All the internal circuits stops.
4. Power circuit and oscillating circuit
 Turn off the built-in power supply and oscillating circuit by power save command and power control command.

Reset Circuit

When the RES input goes active, this LSI enters the initialization status.

© Initialization status

1. Static display control
 SD0, SD1 = 0 : Display OFF
2. Display ON/OFF control
 C = 0 : Cursor OFF
 B = 0 : Blink OFF
 DC = 0 : Double cursor OFF
 D = 0 : Display OFF
3. Power save
 O = 0 : Oscillating circuit OFF
 PS = 0 : Power save OFF
4. Power control
 VC = 0 : Voltage regulating circuit OFF
 VF = 0 : Voltage follower OFF
 P = 0 : Boosting circuit OFF
5. System set
 CG = 0 : Not use of CG RAM

As described in 6.1 MPU Interface, the RES pin is connected to the MPU reset pin and performs initialization concurrently with the MPU.

Regarding the reset signal, a pulse of at least 10 μs or more active level must be input as described in 9. DC Characteristics. Usually, the operation status is started in 1 μs from the edge of the RES signal.

In the SED1230 Series where the built-in liquid crystal power circuit is not used, the RES input must be active when the external liquid crystal power supply is turned on.

After the RES pin goes active, each register is cleared and set to the above set status.

Unless initialization is performed by the RES pin when a power supply voltage is applied, the clear disable status may be provided.

COMMANDS

Table 4 shows a command list. In the SED1230 Series, each data bus signal is identified by a combination of A0 and \overline{WR} (E).

Command interpretation and execution are performed by only internal timing. This permits high-speed processing.

• Outline of Commands

Command type	Command name	A0	WR
Display control instruction	Cursor Home	0	0
	Static Display Control	0	0
	Display ON/OFF Control	0	0
Power control	Power Save	0	0
	Power Control	0	0
	Electronic Volume Register Set	0	0
	Address control instruction	Address Set	0
Data input instruction	Data Write	1	0

The execution time of each instruction is determined by the internal processing time of the SED1230 Series. Accordingly, to execute instructions in succession, reserve a time exceeding the cycle time (*t_{cy}*) and execute the next instruction.

• Outline of Commands

(1) Cursor Home

This command presets the address counter to 30H. When the cursor is displayed, this command moves it to column 1 of line 1.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	*	*	*	*

* : Don't Care

(2) Static Display Control

This command selects display or non-display of static display symbol, and blink ON or OFF. This command is effective in the standby mode only.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	*	*	SD1	SD0

* : Don't Care

- SD1, SD2 = 0, 0 : Display OFF
- 0, 1 : Blink (1 ~ 2 Hz)
- SD1, SD2 = 1, 0 : Blink (3 ~ 4 Hz)
- 1, 1 : All Display ON

(3) Display ON/OFF Control

This command performs display and cursor setting.

Note: Control the symbols that are driven by COMS1 and SEGS1, by the Static Display Control command.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	C	B	DC	D

- D = 0 : Display OFF
- 1 : Display ON

- DC = 0 : Double cursor OFF
- 1 : Double cursor ON

- B = 0 : Cursor blink OFF
- 1 : Cursor blink ON

In the blink state, display characters in normal video and display characters in monochrome reverse video are displayed alternately.

The repetition cycle of alternate display is about 1 second.

- C = 0 : Non-display of cursor
- 1 : Display of cursor

The relationship between C and B registers and cursor display is shown in the following table.

C	B	Cursor display
0	0	Non-display
0	1	Non-display
1	0	Display in monochrome reverse video
1	1	Alternate display of display characters in normal video and display characters in monochrome reverse video

The cursor display position corresponds to the position indicated by address counter.

Accordingly, to move the cursor, change the address counter value by the RAM Address Set command or auto increment by writing RAM data.

If the address counter is set at the symbol register position with (C, B) = (1, 0), symbols can be caused to blink selectively.

- (4) Power Save
This command is used to control the oscillating circuit and set and reset the standby mode or sleep mode.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	*	*	0	PS

* : Don't Care

PS = 0 : Power save OFF (reset)
1 : Power save ON (set)

O = 0 : Oscillating circuit OFF (stop of oscillation)
1 : Oscillating circuit ON (oscillation)

- (5) Power Control
This command is used to control the operation of the built-in power circuit.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	1	0	VC	VF	P

P = 0 : Boosting circuit OFF
1 : Boosting circuit ON

Note: To operate the boosting circuit of the SED1230 Series, the oscillating circuit must be in operation.

VF = 0 : Voltage follower OFF
1 : Voltage follower ON

VC = 0 : Voltage regulating circuit OFF
1 : Voltage regulating circuit ON

- (6) System Set
This command set the use or non-use of display lines and CG RAM.
Execute this command first after turning on the power supply or after resetting.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	N2	N1	*	PS

* : Don't Care

CG = 0 : Non-use of CG RAM
1 : Use of CG RAM

N2 N1
0 0 : 2 lines
0 1 : 3 lines
1 0 : 4 lines

- (7) Electronic Volume Register Set
This command controls the liquid crystal driving voltage V5 output from the voltage regulating circuit of the built-in liquid crystal power supply, thereby adjusting the gradation of liquid crystal display.

When data is set in the 4-bit register, the liquid crystal driving voltage can take one of 16 voltage states.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	1	1	MSB	*	*	LSB

Hex Code
70H ~7FH

MSB	.	.	LSB	V5	IREF
0	0	0	0	Small	0.0 μA
			:	:	:
			:	:	:
1	1	1	1	Large	About 3.65 μA

When the electronic volume function is not used, set (A3, A2, A1, A0) = (0, 0, 0, 0).

- (8) RAM Address Set
This command sets addresses to write data into the DD RAM, CG RAM and symbol register in the address counter.

When the cursor is displayed, the cursor is displayed at the display position corresponding to the DDRAM address set by this command.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1							

ADDRESS

- ① The settable address length is ADDRESS = 00H to 7FH.
- ② Before writing data into the RAM, set the data write address by this command. Next, when data is written in succession, the address is automatically incremented.

RAM Map (SED1230, SED1231, SED1232)

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
00 H	C G R A M (0 0 H)							-	C G R A M (0 1 H)							-

(9) Data Write

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	DATA							

- ① This command writes data into the DD RAM, CG RAM or symbol register.
- ② After this command is executed, the address counter is automatically incremented by 1. This permits writing data in succession.

<Example of Data Writing>

The following is an example of writing one-line data into the DD RAM in succession.

Note: When executing instructions in succession, reserve a time exceeding t_{cy}c and execute the next instruction.

Table 4 SED1230 Series Command List

Command	Code											Function
	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0		
(1) Cursor Home	0	0	0	0	0	1	*	*	*	*		Moves the cursor to the home position.
(2) Static Display Control	0	0	0	0	1	0	*	*	SD1	SD0		Sets the display mode of static display symbol SD1, SD0 = 0, 0 (display OFF), 0, 1 (1 - 2 Hz blink), 1, 0 (3 4 Hz blink), 1, 1 (all display ON)
(3) Display ON/OFF Control	0	0	0	0	1	1	C	B	DC	D		Sets cursor ON/OFF (C), cursor blink ON/OFF (B), double cursor ON/OFF (DC) and display ON/OFF (D). C = 1 (cursor ON) 0 (cursor OFF), B = 1 (blink ON) 0 (blink OFF) DC = 1 (double cursor ON) 0 (double cursor OFF), D = 1 (display ON) D = 0 (display OFF)
(4) Power Save	0	0	0	1	0	0	*	*	0	PS		Sets power save ON/OFF (PS) and oscillating circuit ON/OFF (O). PS = 1 (power save ON) 0 (power save OFF), 0 = 1 (oscillating circuit ON) 0 (oscillating circuit OFF)
(5) Power Control	0	0	0	1	0	1	0	VC	VF	P		Sets voltage regulating circuit ON/OFF and boosting circuit ON/OFF (P). VC = 1 (voltage regulating circuit ON) 0 (voltage regulating circuit OFF) VF = 1 (voltage follower ON) 0 (voltage follower OFF), P = 1 (boosting circuit ON) 0 (boosting circuit OFF)
(6) System Set	0	0	0	1	1	0	N2	N1	*	CG		Sets the use or non-use of CG RAM and display lines (N2, N1). CG = 1 (use of CG RAM) 0 (non-use of CG RAM), N2, N1 = 0, 0 (2 lines) 0, 1 (3 lines) 1, 0 (4 lines)
(7) Electronic Volume Register	0	0	0	1	1	1	MSB	LSB				Sets the electronic volume register value.
(8) RAM Address Set	0	0	1	ADDRESS								Sets the DD RAM, CG RAM or symbol register address.
(9) RAM Write	1	0	DATA								Writes data into the DD RAM, CG RAM or symbol register address.	
(10) NOP	0	0	0	0	0	0	0	0	0	0		Non-operation command
(11) Test Mode	0	0	0	0	0	0	1	0	1	0		Command for IC chip test. Don't use this command.

CHARACTER GENERATOR

Character Generator ROM (CG ROM)

The SED1230 Series is provided with a character generator ROM consisting of a up to 256-type characters. Each character size is 5×7 dots.

Table 5 shows a character code table of the SED1230 Series.

The 4 characters of character codes 00H to 03H are set by the System Set command to specify for which of CG ROM and CG RAM they are to be used.

The CG ROM of the SED1230 Series is a mask ROM and compatible with the user-dedicated CG ROM. Please ask us for further information of it.

Regarding changed CG ROM, it is defined in product name as follows:

(Example) S E D 1 2 3 0 D 0 B

↑

Symbol Register

The SED1230 Series is provided with a symbol register that permits displaying each symbol so that symbol display may be performed on the screen.

The capacity of the symbol register is 64 bits. In case of 12 digits, 48 symbols can be displayed. In case of 16 digits, 64 symbols can be displayed.

The relationship among symbol register display patterns, RAM addresses and write data is shown below.

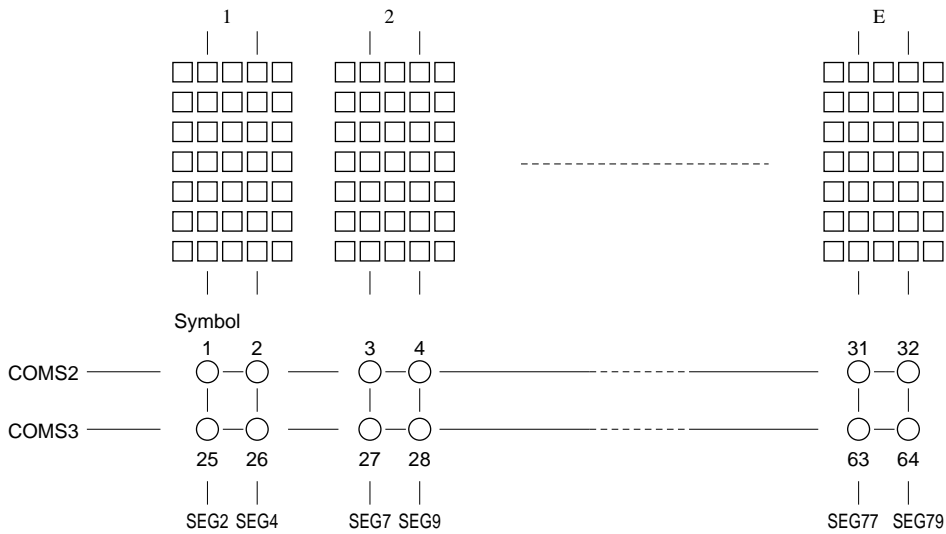

(1) SED1230, SED1231, SED1232

RAM address	Symbol Bits								
	D7				D0				
70H~7CH	0	*	*	*	27	1	28	2	*
	1	*	*	*	29	3	30	4	*
	:	:							
	B	*	*	*	49	23	50	24	*
	C	*	*	*	51	25	52	26	*

Bit
1: Display
0: Not display

(2) SED1233

RAM address	Symbol Bits								Bit	
	D7	D6	D5	D4	D3	D2	D1	D0		
70H~7FH	0	*	*	*	33	1	34	2	*	1: Display
	1	*	*	*	35	3	36	4	*	0: Not display
	:	:								
	E	*	*	*	61	29	62	30	*	
F	*	*	*	63	31	64	32	*		

- Notes
- 1: If the symbol segment size is 1.5 times or more greater than the other dots, it is recommended to be divided into COMS2 and COMS3 and driven separately.
 - 2: The segments other than symbol display must not be crossed through COMS2 or COMS3. The COMS3 symbol register must be set to all zeros if crossing.

ABSOLUTE MAXIMUM RATINGS

Item	Symbol	Standard value	Unit
Power supply voltage (1)	V _{SS}	-6.0~+0.3	V
Power supply voltage (2)	V ₅	-12.0~+0.3	V
Power supply voltage (3)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ ~+0.3	V
Input voltage	V _{IN}	V _{SS} -0.3~+0.3	V
Output voltage	V _O	V _{SS} -0.3~+0.3	V
Operating temperature	T _{opr}	-30~+85	°C
Storage temperature	TCP	-55~+100	°C
	Bare chip	-65~+125	

- Notes:
1. All the voltage values are based on V_{DD} = 0 V.
 2. For voltages of V₁, V₂, V₃ and V₄, keep the condition of V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V₅ and V_{DD} ≥ V_{SS} ≥ V₅ ≥ V_{OUT} at all times.
 3. If the LSI is used exceeding the absolute maximum ratings, it may lead to permanent destruction. In ordinary operation, it is desirable to use the LSI in the condition of electrical characteristics. If the LSI is used out of this condition, it may cause a malfunction of the LSI and have a bad effect on the reliability of the LSI.

DC CHARACTERISTICS

V_{DD} = 0 V, V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C unless otherwise specified.

Item		Symbol	Condition	min	typ	max	Unit	Applicable pin	
Power supply voltage (1)	Recommended operation	V _{SS}		-3.6	-3.0	-2.4	V	V _{SS}	
	Operable			-5.5	-3.0	-2.4		*1	
Power supply voltage (2)	Recommended operation	V ₅		-8.0		-5.0	V	V ₅	
	Operable			-11.0		-4.5		*2	
	Operable	V ₁ , V ₂		0.6×V ₅		V _{DD}	V	V ₁ , V ₂	
	Operable	V ₃ , V ₄		V _{DD}		0.4×V ₅	V	V ₃ , V ₄	
High-level input voltage		V _{IHC}		0.2×V _{SS}		V _{DD}	V	*3	
Low-level input voltage		V _{ILC}		V _{SS}		0.8×V _{SS}	V	*3	
Input leakage current		I _{LI}	V _{IN} = V _{DD} or V _{SS} -1.0		1.0	μA		*3	
LC driver ON resistance		R _{ON}	T _a =25°C V ₅ =-7.0V ΔV=0.1V		20	40	KΩ	COM, SEG *4	
Static current consumption		I _{DD0}			0.1	5.0	μA	V _{DD}	
Dynamic current consumption		I _{DD}	Display state	V ₅ = -7 V without load			100	μA	V _{DD} *5
			Standby state	Oscillation ON, Power OFF			20	μA	V _{DD} *6
			Sleep state	Oscillation OFF, Power OFF			5	μA	V _{DD}
			Access state	f _{cyc} =200KHz			500	μA	V _{DD} *7
Frame frequency		f _{FR}	T _a =25°C V _{SS} =-3.0V	70	100	130	Hz	*11	
Input pin capacity		C _{IN}	T _a =25°C f=1MHz		5.0	8.0	pF	*3	
Reset time		t _R		1.0			μs	*8	
Reset pulse width		t _{RW}		10			μs	*9	
Reset start time		t _{RES}		50			ns	*9	
Built-in power supply	Input voltage	V _{SS}		-3.6		-2.4	V	*10	
	Booster output voltage	V _{OUT}	Double boosting state	-7.2			V	V _{OUT}	
			Triple boosting state	-10.8					
	Voltage follower operating voltage	V ₅		-11.0		-4.5	V		
	Reference voltage (standard)	V _{REG}	T _a = 25°C	-3.5	-3.1	-2.7	V	*12	
	Reference voltage (option 1)	V _{REG(VS1)}	T _a = 25°C	-2.4	-2.1	-1.8	V	*12	
Reference voltage (option 2)	V _{REG(VSS)}	T _a = 25°C	V _{SS}	V _{SS}	V _{SS}	V	*12		

*1: A wide operating voltage range is guaranteed but an abrupt voltage variation in the access status of the MPU is not guaranteed.

*2: The operating voltage range is applicable to the case where an external power supply is used.

*3: D0 ~ D5, D6 (SCL), D7 (SI), A0, RES, $\overline{\text{CS}}$ $\overline{\text{WR}}$ (E), P/S, IF

*4: This is a resistance value when a voltage of 0.1 V is applied between output pin SEG_n, SEG_S_n, COM_n or COM_S_n, and each power pin (V₁, V₂, V₃ or V₄). It is specified in the range of operating voltage (2).

$$R_{ON} = 0.1 \text{ V} / \Delta I$$

(ΔI: Current flowing when 0.1 V is applied between the power and output)

- *5: Character “” display. This is applicable to the case where no access is made from the MPU and the built-in power circuit and oscillating circuit are in operation.
- *6: This is applicable to the case where the built-in power circuit is OFF and the oscillating circuit is in operation in the standby mode.
- *7: Current consumption when data is always written by f_{cyc} .
The current consumption in the access state is almost proportional to the access frequency (f_{cyc}).
When no access is made, only $I_{DD(I)}$ occurs.
- *8: t_R (reset time) indicates the internal circuit reset completion time from the edge of the RES signal. Accordingly, the SED123* usually enters the operating state after t_R .
- *9: Specifies the minimum pulse width of the RES signal. It is reset when a signal having the pulse width greater than t_{RW} is entered.
- *10: When operating the boosting circuit, the power supply VSS must be used within the input voltage range.

*11: The fOSC frequency of the oscillator circuit for internal circuit drive may differ from the fBST boosting clock on some models. The following provides the relationship between the fOSC frequency, fBST boosting clock, and fFR frame frequency.

$$f_{OSC} = (\text{No. of digits}) \times (1/\text{Duty}) \times f_{FR}$$

$$f_{BST} = (1/2) \times (1/\text{No. of digits}) \times f_{OSC}$$

Example: The SED1230 has 13 digits of display and 1/30 duty.

$$f_{OSC} = 13 \times 30 \times 100 = 39 \text{ kHz}$$

$$f_{BST} = (1/2) \times (1/13) \times 39 \text{ K} = 1.5 \text{ kHz}$$

*12: The VREG reference voltage has the temperature characteristics of approximately $-0.17\%/^{\circ}\text{C}$ (standard specifications). An optional model having the temperature characteristics of approximately $-0.04\%/^{\circ}\text{C}$ is also available. The voltage of power supply terminal VSS can be selected as the reference power supply as an option without using the reference voltage inside the IC. In this case, however, a regulator is used for the external power supply ($V_{DD} - V_{SS}$). The voltage accuracy of V5 depends on that of the regulator used. The CGROM modification rules apply to the optional models.

All signal timings are based on 20% and 80% of VSS signals.

TIMING CHARACTERISTICS

(1) System Bus Write Characteristic I (80 series MPU)

[V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C unless otherwise specified]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address hold time	A0, \overline{CS}	t _{AH8}		30		ns
Address setup time	A0, \overline{CS}	t _{AW8}		60		ns
System cycle time	\overline{WR}	t _{CYC8}	V _{SS} = -3.0	500		ns
Control pulse width (\overline{WR})		t _{CC}	-2.7	550		ns
			-2.4	650		
			-3.0	100		
			-2.4	150		
Data setup time	D0 ~ D7	t _{DS8}		100		ns
Data hold time	D0 ~ D7	t _{DH8}		50		ns

*1: For the rise and fall of an input signal, set a value not exceeding 25 ns.

*2: Every timing is specified on the basis of 20% and 80% of V_{SS}.

*3: For A0 and \overline{CS} , the same time is not required. Input signals so that A0 and \overline{CS} may satisfy t_{AW8} and t_{AH8} respectively.

(2) System Bus Write Characteristic II (68 series MPU)

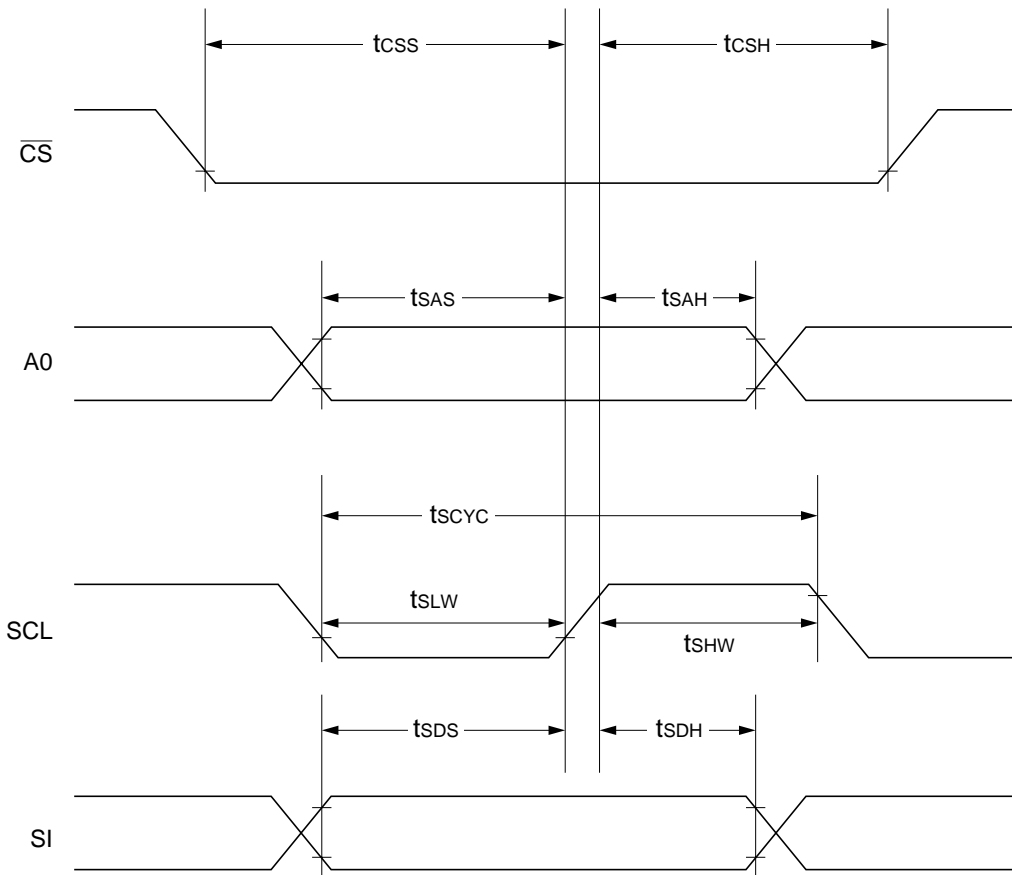

[V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C unless otherwise specified]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
System cycle time	A0, \overline{CS}	t _{CYC6}	V _{SS} = -3.0 -2.7 -2.4	500 550 650		ns
Address setup time		t _{AW6}		60		
Address hold time		t _{AH6}		30		ns
Data setup time	D0 ~ D7	t _{DS6}		100		ns
Data hold time		t _{DH6}		50		ns
Enable pulse width	E	t _{EW}	V _{SS} = -3.0 -2.7 -2.4	100 120 150		ns

- *1: t_{CYC6} denotes the cycle of the E signal in the \overline{CS} active state. t_{CYC6} must be reserved after \overline{CS} becomes active.
- *2: For the rise and fall of an input signal, set a value not exceeding 25 ns.
- *3: Every timing is specified on the basis of 20% and 80% of V_{SS}.
- *4: For A0 and CS, the same timing is not required. Input signals so that A0 and \overline{CS} may satisfy t_{AW6} and t_{AH6} respectively.

(3) Serial Interface

[V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
System clock cycle	SCL	tSCYC	V _{SS} = -3.0	700		ns
			-2.7	800		ns
			-2.4	1000		ns
SCL "H" pulse width		tSHW		300		ns
SCL "L" pulse width		tSLW		300		ns
Address setup time Address hold time	A0	tsAS tsAH	V _{SS} = -3.0	50		ns
			-2.7	350		ns
			-2.4	400		ns
Data setup time Data hold time	SI	tSDS tSDH		500		ns
				50		ns
\overline{CS} -SCL time	\overline{CS}	tCSS tCSH	V _{SS} = -3.0	150		ns
			-2.7	550		ns
			-2.4	650		ns
				700		ns

*1: For the rise and fall of an input signal, set a value not exceeding 25 ns.

*2: Every timing is specified on the basis of 20% and 80% of V_{SS}.

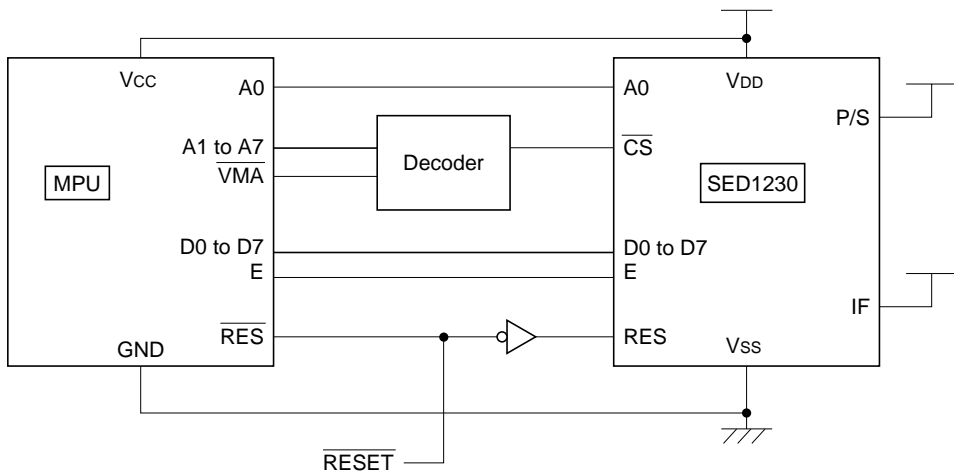

MPU INTERFACE (REFERENCE EXAMPLES)

The SED1230 Series can be connected to the 80 series MPU and 68 series MPU. When an serial interface is used, the SED1230 Series can be operated by less signal lines.

80 Series MPU

68 Series MPU

LIQUID CRYSTAL DRIVE WAVEFORMS (B WAVEFORMS)

Instruction Setup Example (Reference Only)

(1) Initial setup

(2) Display mode

(Note 1)
(Note 1)

Note 1: Commands (6) and (7) initialize the RAM. The display contents must first be set. The non-display area must satisfy the following conditions (for RAM clear).

- DDRAM: Write the 20H data (character code).
- CGRAM: Write the 00H data (null data).
- Symbol register: Write the 00H data (null data).

As the RAM data is unstable during reset signal input (after power-on), null data must be written. If not, unexpected display may result.

(3-1) Selecting the Standby mode

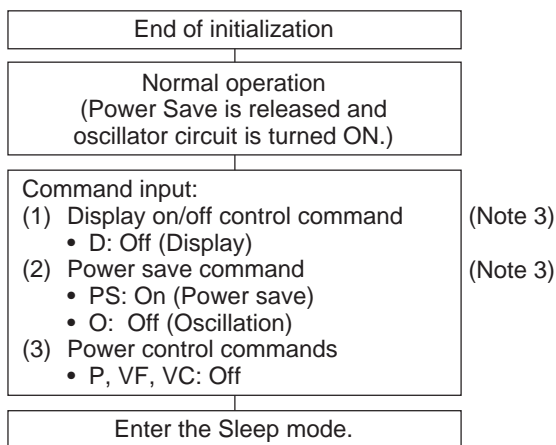

(3-2) Releasing the Standby mode

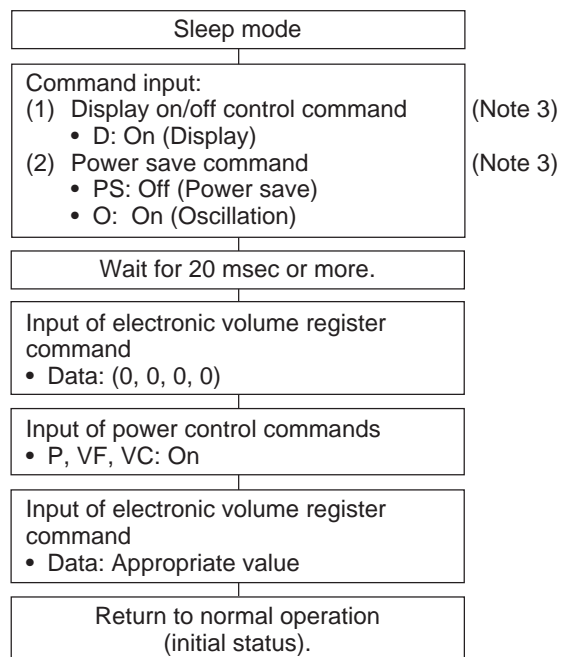

Note 2: Commands (1) and (2) can be entered in any order. Also, command (1) is optional.

(4-1) Selecting the Sleep mode

(4-2) Releasing the Sleep mode

Note 3: Commands (1) and (2) can be entered in any order. Also, command (1) is optional.

OVERVIEW

The SED1234, 1235 Series is a dot matrix LCD controller driver for character display, and can display a maximum of 48 characters, 4 user-defined characters, and a maximum of 48 symbols by means of 4-bit, 8-bit or serial data sent from a microcomputer.

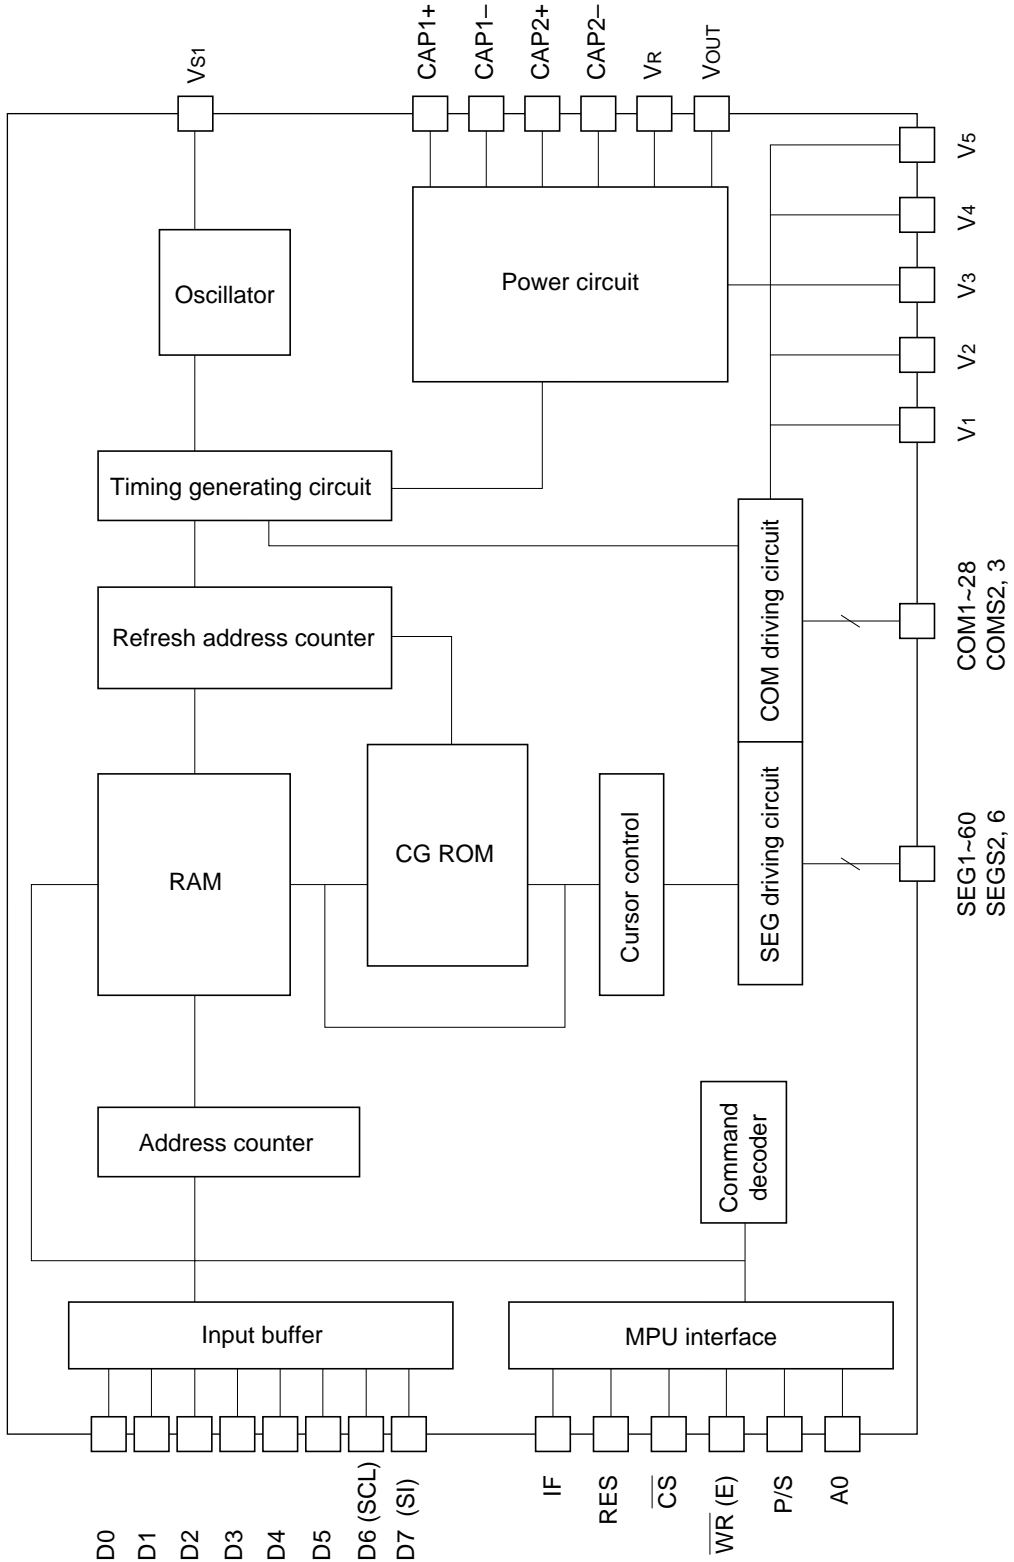

A built-in character generator ROM is prepared for 256 character types, and each character font consists of 5×7 dots. A user-defined character RAM for four characters of 5×7 dots are incorporated, and a symbol register is also incorporated. With these, it is possible to apply this Series to display with a high degree of freedom. This Series can operate handy units with a minimum power consumption by means of its low power consumption and sleep mode.

SED1234, and 1235 depending on the duty of use and the number of display columns.

FEATURES

- Built-in diplay RAM
48 characters + 4 user-defined characters + 48 symbols
- CG ROM (for up to 256 characters), CG RAM (4 characters), and symbol register (48 symbols)
- Number of display columns \times number of lines
(12 columns + 2 segment for signal) \times 4 lines + 48 symbols: SED1234
(12 columns + 2 segment for signal) \times 2 lines + 48 symbols: SED1235
- CR oscillation circuit (on-chip C and R)
- High-speed MPU interface
Interfacing with both 68 series and 80 series MPU
Interfacing in 4 bits/8 bits
- Serial interface
- Character font 5×7 dots
- Duty ratio 1/16 (SED1235)
1/30 (SED1234)
- Simple command setting
- Built-in liquid crystal driving power circuit
Power boosting circuit, power regulating circuit, voltage follower \times 4
- Built-in electronic volume function
- Low power consumption
100 μ A Max. (In normal operation mode:
Including the operating current
of the built-in power supply)
- Power supply
VDD - VSS (logic section): -2.4 V to -3.6 V
VDD - V5 (liquid crystal drive section)
: -5.0 V to -8.0 V
- Wide operating temperature range
Ta = -30 to 85°C
- CMOS process (Pad Pitch)
- COB assemble 126 μ m min.
- Delivery form: Chip SED123*D*A, SED123*D*C
- This IC is not designed with a protection against radioactive rays.

DESCRIPTION OF PINS

Power Pins

Pin name	I/O	Description	Q'ty
VDD	Power supply	Logic + power pin. Also used as MPU power pin Vcc.	2
VSS	Power supply	Logic – power pin. Connected to the system GND.	2
V0, V1 V2, V3 V4, V5	Power supply	Multi-level power supply for liquid crystal drive. The voltage determined in the liquid crystal cell is resistance-divided or impedance-converted by operational amplifier, and the resultant voltage is applied. The potential is determined on the basis of VDD and the following equation must be respected. $V_{DD} = V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$, $V_{DD} \geq V_{SS} \geq V_5 \geq V_{OUT}$ When the built-in power supply is ON, the following voltages are given to pins V1 to V4 by built-in power circuit: $V_1 = 1/5 V_5$ $V_2 = 2/5 V_5$ $V_3 = 3/5 V_5$ $V_4 = 4/5 V_5$	6
Vs1	O	Power supply voltage output pin for oscillating circuit. Don't connect this pin to an external load.	1

LCD Power Circuit Pins

Pin name	I/O	Description	Q'ty
CAP1+	O	Capacitor positive side connecting pin for boosting. This pin connects the capacitor with pin CAP1–.	1
CAP1–	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP+.	1
CAP2+	O	Capacitor positive side connecting pin for boosting. This pin connects a capacitor with pin CAP2–.	1
CAP2–	O	Capacitor negative side connecting pin for boosting. This pin connects a capacitor with pin CAP2+.	1
VOUT	O	Output pin for boosting. This pin connects a smoothing capacitor with VSS pin.	1
VR	I	Voltage regulating pin. This pin gives a voltage between VDD and V5 by resistance-division of voltage.	1

Pins for System Bus Connection

Pin name	I/O	Description	Q'ty																		
D7 (SI) D6 (SCL) D5 ~ D0	I	8-bit input data bus. These pins are connected to a 8-bit or 16-bit standard MPU data bus. When P/S = "Low", the D7 and D6 pins are operated as a serial data input and a serial clock input respectively. <table border="1"> <thead> <tr> <th>P/S</th> <th>D7</th> <th>D6</th> <th>D5 ~ D0</th> <th>\overline{CS}</th> <th>A0</th> </tr> </thead> <tbody> <tr> <td>"Low"</td> <td>SI</td> <td>SCL</td> <td>—</td> <td>\overline{CS}</td> <td>A0</td> </tr> <tr> <td>"High"</td> <td>D7</td> <td>D6</td> <td>D5 ~ D0</td> <td>\overline{CS}</td> <td>A0</td> </tr> </tbody> </table>	P/S	D7	D6	D5 ~ D0	\overline{CS}	A0	"Low"	SI	SCL	—	\overline{CS}	A0	"High"	D7	D6	D5 ~ D0	\overline{CS}	A0	8
P/S	D7	D6	D5 ~ D0	\overline{CS}	A0																
"Low"	SI	SCL	—	\overline{CS}	A0																
"High"	D7	D6	D5 ~ D0	\overline{CS}	A0																
A0	I	Usually, this pin connects the least significant bit of the MPU address bus and identifies a data command. 0 : Indicates that D0 to D7 are a command. 1 : Indicates that D0 to D7 are display data.	1																		
RES	I	In case of a 68 series MPU, initialization can be performed by changing RES $\square\downarrow$. In case of an 80 series MPU, initialization can be performed by changing $\square\uparrow$. A reset operation is performed by edge sensing of the RES signal. An interface type for the 68/80 series MPU is selected by input level after initialization. "L" : 80 series MPU interface "H" : 68 series MPU interface	1																		
\overline{CS}	I	Chip select signal. Usually, this pin inputs the signal obtained by decoding an address bus signal. At the "Low" level, this pin is enabled.	1																		
\overline{WR} (E)	I	<When connecting an 80 series MPU> Active "Low". This pin connects the \overline{WR} signal of the 80 series MPU. The signal on the data bus is fetched at the rise of the \overline{WR} signal. <When connecting a 68 series MPU> Active "High". This pin becomes an enable clock input of the 68 series MPU.	1																		
P/S	I	This pin switches between serial data input and parallel data input. <table border="1"> <thead> <tr> <th>P/S</th> <th>Chip Select</th> <th>Data/Command</th> <th>Data</th> <th>Serial Clock</th> </tr> </thead> <tbody> <tr> <td>"High"</td> <td>\overline{CS}</td> <td>A0</td> <td>D0~D7</td> <td>—</td> </tr> <tr> <td>"Low"</td> <td>\overline{CS}</td> <td>A0</td> <td>SI</td> <td>SCL</td> </tr> </tbody> </table>	P/S	Chip Select	Data/Command	Data	Serial Clock	"High"	\overline{CS}	A0	D0~D7	—	"Low"	\overline{CS}	A0	SI	SCL	1			
P/S	Chip Select	Data/Command	Data	Serial Clock																	
"High"	\overline{CS}	A0	D0~D7	—																	
"Low"	\overline{CS}	A0	SI	SCL																	
IF	I	Interface data length select pin for parallel data input. "High": 8-bit parallel input "Low": 4-bit parallel input When P/S = "Low", connect this pin to VDD or Vss.	1																		

Liquid Crystal Drive Circuit Signals

SED1234

Pin name	I/O	Description	Q'ty
COM1~ COM28	O	Common signal output pin (for characters)	28
COMS2, CMOS3	O	Common signal output pin (except for characters) CMOS2, CMOS3: Common output for symbol display	2

SEGS2, SEGS6	O	Segment signal output pin (except for characters) SEGS2, SEGS6: Segment output for signal output	2

FUNCTIONAL DESCRIPTION

MPU Interface

Selection of interface type

In the SED1234, SED1235, data transfer is performed through a 8-bit or 4-bit data bus or a serial data input (SI). By selecting “High” or “Low” as P/S pin polarity, a parallel data input or a serial data input can be selected as shown in Table 1.

Table 1

P/S	Type	\overline{CS}	A0	\overline{WR}	SI	SCL	D0~D7
“High”	Parallel Input	\overline{CS}	A0	\overline{WR}	—	—	D0~D7
“Low”	Serial Input	CS	A0	—	SI	SCL	—

Parallel Input

In the SED1234, SED1235, when parallel input is selected (P/S = “High”), it can be directly connected to the 80 series MPU bus or 68 series MPU bus, as shown in Table 2, if either “High” or “Low” is selected as RES pin polarity after a reset input, because the RES pin has an MPU select function.

Selection between 8 bits and 4 bits is performed by command.

Table 2

RES input polarity	Type	A0	\overline{WR}	\overline{CS}	D0~D7
High-to-low active	68 series	A0	E	\overline{CS}	D0~D7
Low-to-high active	80 series	A0	\overline{WR}	\overline{CS}	D0~D7

Interface with 4-bit MPU interface

When data transfer is performed by 4-bit interface (IF = 0), an 8-bit command, data and address are divided into two parts.

Note: When performing writing in succession, reverse a time exceeding the system cycle time (t_{cyc}) and then perform writing.

Serial interface (P/S = “Low”)

The serial interface consists of a 8-bit shift register and a 3-bit counter and acceptance of an SI input or SCL input is enabled in the ship selected status (CS = “Low”).

When no chip is selected, the shift register and counter are reset to the initial status.

Serial data is input in the order of D7, D6 ... D0 from the serial data input pin (SI) at the rise of Serial Clock (SCL). At the rising edge of the 8th serial clock, the serial data is converted into 8-bit parallel data and this data is processed. The A0 input is used to identify whether the serial data input (SI) is display data or a command. That is, when A0 = “High”, it is regarded as display data. When A0 = “Low”, it is regarded as a command.

The A0 input is read in and identified at the rise of the 8 x n-th clock of Serial Clock (SCL) after chip selection.

Fig. 1 shows a timing chart of the serial interface.

Regarding the SCL signal, special care must be exercised about terminal reflection and external noise due to a wire length. We recommend the user to perform an operation check with a real machine.

We also recommend the user to periodically refresh the write status of each command to prevent a malfunction due to noise.

Fig. 1

Identification of data bus signals

The SED1234, SED1235 series identifies data bus signals, as shown in Table 3, by combinations of A0 and \overline{WR} (E).

Table 3

Common	68 series	80 series	Function
A0	E	\overline{WR}	
1	1	0	Writing to RAM and symbol register
0	1	0	Writing to internal register (command)

Chip select

The SED1234, SED1235 series has a chip select pin (\overline{CS}). Only when \overline{CS} = “Low”, MPU interfacing is enabled. In any status other than Chip Select, D0 to D7 and A0, \overline{WR} , S1 and SCL inputs are invalidated. When a serial input interface is selected, the shift register and counter are reset.

However, the Reset signal is input regardless of the \overline{CS} status.

Power Circuit

This is a low-power-consumption power circuit that generates a voltage required for liquid crystal drive. The power circuit consists of a boosting circuit, voltage regulating circuit and voltage follower.

The power circuit incorporated in the SED1234, SED1235 Series is set for a small-scale liquid crystal panel, so that its display quality may be greatly deteriorated if it is used for a liquid crystal panel with a large display capacity. In this case, an external power supply must be used.

A power circuit function can be selected by power control command. With this, an external power supply and a part of the internal power supply can be used together.

	Boosting circuit	Voltage regulating circuit	Voltage follower	External voltage input	Boosting system pin
	○	○	○	—	
Note 1	×	○	○	V _{OUT}	OPEN
Note 2	×	×	○	V ₅ = V _{OUT}	OPEN
Note 3	×	×	×	V ₁ , V ₂ , V ₃ , V ₄ , V ₅	OPEN

Note 1: When the boosting circuit is turned off, make boosting system pins (CAP1+, CAP1-, CAP2+, CAP2-) open and give a liquid crystal drive voltage to the V_{OUT} pin from the outside.

Note 2: When the voltage regulating circuit is not used with the boosting circuit OFF, make the boosting system pins open, connect between the V₅ pin and V_{OUT} pin, and give a liquid crystal drive voltage from the outside.

Note 3: When all the internal power supplies are turned off, supply liquid crystal drive voltages V₁, V₂, V₃, V₄ and V₅ from the outside, and make the CAP1+, CAP1-, CAP2+, CAP2- and V_{OUT} pins open.

Triple boosting circuit

When a capacitor is connected between CAP1+ and CAP1-, between CAP2+ and CAP2-, and between VSS pin and VOUT pin respectively, the potential between the VDD pin and VSS pin is boosted triple and output to the VOUT pin. In case of double boosting, remove the capacitor between CAP2+ and CAP2- in connection for triple boosting operation and strap between CAP2- and

VOUT pin. Then, a double boosted output can be obtained from the VOUT pin (CAP2-).

The boosting circuit uses a signal from the oscillator output.

Accordingly, it is necessary that the oscillating circuit must be in operation. The potential relationship of boosting is shown below.

Potential during double boosting

Potential during triple boosting

Voltage regulating circuit

The voltage regulation circuit regulates the boosted voltage developed at Vout. It outputs the regulated LCD driving voltage at the V5 terminal. An internal resistor can be inserted into the regulation circuit feedback loop providing the following voltage levels at the V5 terminal.

The voltage regulator circuit carries a temperature gradient of about -0.17%/°C under VREG outputs. When any other temperature gradient is required, connect a thermistor in series to the output voltage regulating register.

When V5 is required to be different than the above case, leave the internal feedback resistor out of the circuit. V5 can be regulated within a range of |V5|<|VOUT|. It may be calculated by the following formula:

Since the VR terminal has a high input impedance, it is necessary to take noise suppression measures such as shortening the input wiring and shielding the wiring run.

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) \cdot V_{REG} \dots\dots\dots \textcircled{1}$$

Wherein, VREG is the constant voltage source inside the SED1230 Series and the voltage is constant at VREG ≈ 3.1V. Voltage regulation of the V5 output is accomplished by connecting a variable resistor between VR, VDD and V5. For fine adjustment of the V5 voltage, use a combination of fixed resistors R1 and R3 and a variable resistor R2.

Example 1:

Condition: I(R1, R2, R3) ≤ 5μA V5 = -6 to -8V

$$\left. \begin{array}{l} \text{Setting: } R_1 + R_2 + R_3 = 8V / 5\mu A = 1.6M\Omega \\ 8V = (1 + R_b/R_a) \cdot 3.0V \quad R_b/R_a = 1.67 \\ 6V = (1 + R_b/R_a) \cdot 3.0V \quad R_b/R_a = 1 \end{array} \right\} \dots \left\{ \begin{array}{l} R_1 = 600K\Omega \\ R_2 = 200K\Omega \\ R_3 = 800K\Omega \end{array} \right.$$

SED1234/35 Series

● Voltage Regulation Circuit Using Electronic Contrast Control Register

The contrast control register controls the liquid crystal driving voltage (V5). This is accomplished by an electronic volume control register set command that adjusts the contrast of the liquid crystal display (see section 1-22).

The commands provide 4-bits of voltage level data to the electronic volume control register. This provides for the selection of 16 different voltage levels for the liquid crystal driving voltage. When using the electronic volume control function, it is necessary to close the voltage regulation circuit using electronic control commands. For reference information, when the electronic volume control register value is at (1, 1, 1, 1), the constant current value becomes: $I_{REF} \approx 3.65\mu A$.

[An exemplary constant setting when the electronic volume control function is being used]

$$V_5 = \left(1 + \frac{R_b}{R_c}\right) \cdot V_{REG} \dots \dots \dots \textcircled{2}$$

$$R_c = \frac{R_a \times R_I}{R_a + R_I}$$

$$R_I = \frac{V_R}{I_{REF}}$$

Fig. 9

- (1) Determining the V5 voltage setting range by the electronic volume control
Liquid crystal driving voltage V5: max. -6v ~ min. -8V
V5 variable voltage range: 2V

- (2) Determining the Rb
 $R_b = V_5 \text{ variable voltage range} / I_{REF}$
 $= 2V / 3.65\mu A$
 $= 548K\Omega$

- (3) Determining the Ra
 $R_a = \frac{V_{REG}}{(V_5 \text{ voltage setting max} - V_{REG}) / R_b}$ (Use absolute values for VREG and V5 voltage settings.)
 $= \frac{3.1V}{(6V - 3.1V) / 548K\Omega}$
 $= 585K\Omega$

- (4) Regulating the Ra
Set the electronic volume control register to (D3, D2, D1, D0) = (1, 0, 0, 0) or (0, 1, 1, 1) before matching the Ra value to the optimum contrast.

Since IREF is a simplified constant voltage source, fluctuations upto ± 40% must be taken into consideration, as a dispersion range during manufacture. Meanwhile, the temperature dependency of IREF is : $\Delta I_{REF} \approx -0.037\mu A/^\circ C$. Determine the Ra and Rb for the using LCD panel in consideration of the above dispersion and the variation by the temperature.

When using the electronic volume control function, in order to compensate the V5 voltage for dispersion of VREG and IREF, use a variable resistor as Ra and perform optimum contrast adjustment according to the above item (4) with each IC chip.

When the electronic volume control function is not being used, set the electronic volume control register to (0, 0, 0, 0) using the RES signal or the electronic volume control register setting command.

Liquid crystal voltage generating circuit

The V5 potential is resistance-divided inside the IC so that V1, V2, V3 and V4 potentials are generated for liquid crystal drive.

Furthermore, the V1, V2, V3 and V4 are impedance-converted by voltage follower and the then supplied to

the liquid crystal drive circuit.

The liquid crystal drive voltage is fixed to 1/5 bias.

As shown in the diagrams below, the capacitor (C2) for voltage stabilization must be externally connected to the V1 to V5 pins of liquid crystal power pins.

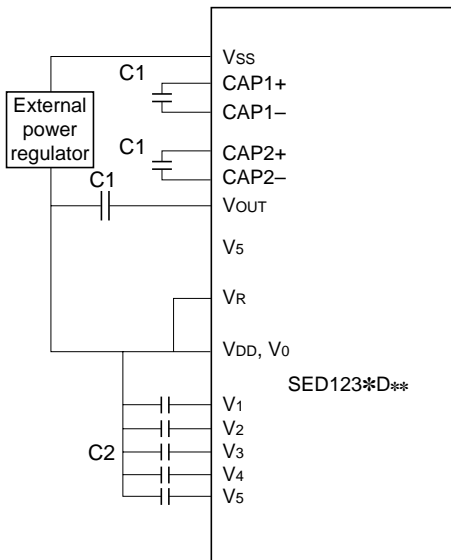

When a built-in power supply is used
Under a triple boosting

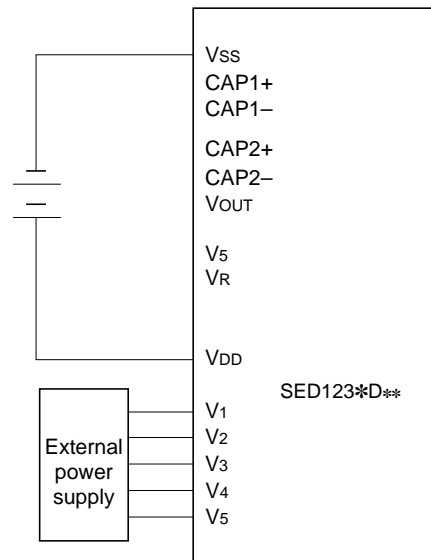

The diagram under a double boosting

When an external power regulator is used
(The built-in power regulator is not used)

When a built-in power supply is not used

Reference setting values: C1: 0.1 - 4.7 μ F
C2: 0.1 μ F

We recommend the user to set the optimum values to capacitors C1 and C2 according to the panel size watching the liquid crystal display and drive waveforms.

SED1234/35 Series

Low Power Consumption Mode

The SED1234, SED1235 Series is provided with the standby mode and sleep mode with the object of low power consumption when the unit is in the standby state.

● Sleep Mode

After the power circuit and oscillating circuit are turned off by command and the power save command is executed, the sleep mode is set. This mode permits reducing current consumption nearly to the static current value.

1. Liquid crystal display output
COM1 ~ COM28, COMS2, COMS3 : V_{DD} level
SEG1 ~ SEG60, SEGS2, SEGS6 : V_{DD} level
2. DD RAM, CG RAM and symbol register
Written contents do not change and are stored regardless of whether the sleep mode is turned on or off.
3. In the operation mode, the status precedent to execution of the sleep mode is held. All the internal circuits stops.
4. Power circuit and oscillating circuit
Turn off the built-in power supply and oscillating circuit by power save command and power control command.

Reset Circuit

When the RES input goes active, this LSI enters the initialization status.

1. Display ON/OFF control
 - C = 0 : Cursor OFF
 - B = 0 : Blink OFF
 - DC = 0 : Double cursor OFF
 - D = 0 : Display OFF
2. Power save
 - O = 0 : Oscillating circuit OFF
 - PS = 0 : Power save OFF
3. Power control
 - VC = 0 : Voltage regulating circuit OFF
 - VF = 0 : Voltage follower OFF
 - P = 0 : Boosting circuit OFF
4. System set
 - CG = 0 : No use of CG RAM

As described in 6.1 MPU Interface, the RES pin is connected to the MPU reset pin and performs initialization concurrently with the MPU.

Regarding the reset signal, a pulse of at least 10 μ s or more active level must be input as described in 9. DC Characteristics. Usually, the operation status is started in 1 μ s from the edge of the RES signal.

In the SED 1230 Series where the built-in liquid crystal power circuit is not used, the RES input must be active when the external liquid crystal power supply is turned on.

COMMANDS

Table 4 shows a command list. In the SED1230 Series, each data bus signal is identified by a combination of A0 and \overline{WR} (E).

Command interpretation and execution are performed by only internal timing. This permits high-speed processing.

• Outline of Commands

Command type	Command name	A0	WR
Display control instruction	Cursor Home	0	0
	Display ON/OFF Control	0	0
Power control	Power Save	0	0
	Power Control	0	0
	Electronic Volume Register Set	0	0
Address control instruction	Address Set	0	0
Data input instruction	Data Write	1	0

The execution time of each instruction is determined by the internal processing time of the SED1230 Series. Accordingly, to execute instructions in succession, reserve a time exceeding the cycle time (t_{cyc}) and execute the next instruction.

• Outline of Commands

(1) Cursor Home

This command presets the address counter to 30H. When the cursor is displayed, this command moves it to column 1 of line 1.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	*	*	*	*

* : Don't Care

(2) Display ON/OFF Control

This command performs display and cursor setting.

Note: Control the symbols that are driven by COMS1 and SEGS1, by the Static Display Control command.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	C	B	DC	D

D = 0 : Display OFF
1 : Display ON

DC = 0 : Double cursor OFF
1 : Double cursor ON

B = 0 : Cursor blink OFF
1 : Cursor blink ON

In the blink state, display characters in normal video and display characters in monochrome reverse video are displayed alternately. The repetition cycle of alternate display is about 1 second.

C = 0 : Non-display of cursor
1 : Display of cursor

The relationship between C and B registers and cursor display is shown in the following table.

C	B	Cursor display
0	0	Non-display
0	1	Non-display
1	0	Display in monochrome reverse video
1	1	Alternate display of display characters in normal video and display characters in monochrome reverse video

The cursor display position corresponds to the position indicated by address counter.

Accordingly, to move the cursor, change the address counter value by the RAM Address Set command or auto increment by writing RAM data.

If the address counter is set at the symbol register position with (C, B) = (1, 0), symbols can be caused to blink selectively.

(3) Power Save

This command is used to control the oscillating circuit and set and reset sleep mode.

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	*	*	O	PS

* : Don't Care

PS = 0 : Power save OFF (reset)
1 : Power save ON (set)

O = 0 : Oscillating circuit OFF (stop of oscillation)
1 : Oscillating circuit ON (oscillation)

- (4) Power Control
This command is used to control the operation of the built-in power circuit.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	1	0	VC	VF	P

P = 0 : Boosting circuit OFF
1 : Boosting circuit ON

Note: To operate the boosting circuit the oscillating circuit must be in operation.

VF = 0 : Voltage follower OFF
1 : Voltage follower ON

VC = 0 : Voltage regulating circuit OFF
1 : Voltage regulating circuit ON

- (5) System Set
This command set the use or non-use of display lines and CG RAM.
Execute this command first after turning on the power supply or after resetting.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	0	0	N2	N1	*	PS

* : Don't Care

CG = 0 : Use of CG RAM
1 : Non-use of CG RAM

N2 N1
0 0 : 2 lines
0 1 : 3 lines
1 0 : 4 lines

- (6) Electronic Volume Register Set
This command controls the liquid crystal driving voltage V5 output from the voltage regulating circuit of the built-in liquid crystal power supply,

thereby adjusting the gradation of liquid crystal display.

When data is set in the 4-bit register, the liquid crystal driving voltage can take one of 16 voltage states.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	1	1	MSB	*	*	LSB

Hex Code

70H ~7FH

MSB	.	.	LSB	V5	IREF
0	0	0	0	Small	0.0μA
		:	:	:	:
		:	:	:	:
1	1	1	1	Large	3.65μA

When the electronic volume function is not used, set (A3, A2, A1, A0) = (0, 0, 0, 0).

- (7) RAM Address Set
This command sets addresses to write data into the DD RAM, CG RAM and symbol register in the address counter.

When the cursor is displayed, the cursor is displayed at the display position corresponding to the DDRAM address set by this command.

A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1							

- The settable address length is ADDRESS = 00H to 7FH.
- Before writing data into the RAM, set the data write address by this command. Next, when data is written in succession, the address is automatically incremented.

RAM Map

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
00H	C G R A M (00H)							-	C G R A M (01H)							-
10H	C G R A M (02H)							-	C G R A M (03H)							-
20H	Unused															
30H	DDRAM line 1										Unused					
40H	DDRAM line 2										" For signals					
50H	DDRAM line 3										"					
60H	DDRAM line 4										"					
70H	Symbol register															

- : Unused
For signals : Output from SEGS2 to SEGS6.

(8) Data Write

A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
1	0	DATA							

- ① This command writes data into the DD RAM, CG RAM or symbol register.
- ② After this command is executed, the address counter is automatically incremented by 1. This permits writing data in succession.

<Example of Data Writing>

The following is an example of writing one-line data into the DD RAM in succession.

Note: When executing instructions in succession, reserve a time exceeding tcyc and execute the next instruction.

Table 4 SED1234/SED1235 Command List

Command	Code											Function
	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0		
(1) Cursor Home	0	0	0	0	0	1	*	*	*	*		Moves the cursor to the home position.
(2) Display ON/OFF Control	0	0	0	0	1	1	C	B	DC	D		Sets cursor ON/OFF (C), cursor blink ON/OFF (B), double cursor ON/OFF (DC) and display ON/OFF (D). C = 1 (cursor ON) 0 (cursor OFF), B = 1 (blink ON) 0 (blink OFF) DC = 1 (double cursor ON) 0 (double cursor OFF), D = 1 (display ON) 0 (display OFF)
(3) Power Save	0	0	0	1	0	0	*	*	0	PS		Sets power save ON/OFF (PS) and oscillating circuit ON/OFF (O). PS = 1 (power save ON) 0 (power save OFF), O = 1 (oscillating circuit ON) 0 (oscillating circuit OFF)
(4) Power Control	0	0	0	1	0	1	0	VC	VF	P		Sets voltage regulating circuit ON/OFF and boosting circuit ON/OFF (P). VC = 1 (voltage regulating circuit ON) 0 (voltage regulating circuit OFF) VF = 1 (voltage follower ON) 0 (voltage follower OFF), P = 1 (boosting circuit ON) 0 (boosting circuit OFF)
(5) System Set	0	0	0	1	1	0	N2	N1	*	CG		Sets the use or non-use of CG RAM and display lines (N2, N1). CG = 1 (use of CG RAM) 0 (non-use of CG RAM), N2, N1 = 0, 0 (2 lines) 0, 1 (3 lines) 1, 0 (4 lines)
(6) Electronic Volume Register	0	0	0	1	1	1	MSB	LSB				Sets the electronic volume register value.
(7) RAM Address Set	0	0	1	ADDRESS								Sets the DD RAM, CG RAM or symbol register address.
(8) RAM Write	1	0	DATA								Writes data into the DD RAM, CG RAM or symbol register address.	
(9) NOP	0	0	0	0	0	0	0	0	0	0		Non-operation command
(10) Test Mode	0	0	0	0	0	0	1	0	1	0		Command for IC chip test. Don't use this command.

CHARACTER GENERATOR

Character Generator ROM (CG ROM)

The SED1234/1235 is provided with a character generator ROM consisting of a up to 256-type characters. Each character size is 5×7 dots.

Table 5 shows a character code table of the SED1230 Series.

The 4characters of character codes 00H to 03H are set by the System Set command to specify for which of CG ROM and CG RAM they are to be used.

The CG ROM of the SED1234/1235 is a mask ROM and compatible with the use-dedicated CG ROM. Please ask us for further information of it.

Regarding changed CG ROM, it is defined in product name as follows:

(Example) S E D 1 2 3 4 D 0 A

↑

Character Generator RAM (CG RAM)

The SED1230 Series is provided with a CG RAM that permits user-programming character patterns so that they can be displayed with a high degree of freedom for signal display.

Before using the CG RAM, select the use of CG RAM by the System Set command.

The capacity of the CG RAM is 140 bits and arbitrary patterns of 4 types consisting of 5×7 dots can be registered.

The relationship among CG RAM patterns, CG RAM addresses, and character codes is shown below.

Character code	RAM address	CGRAM data (character pattern)								Display	
		D7							D0		
00H 02H	00H~06H 10H~16H	0	*	*	*	0	1	1	1	1	
		1	*	*	*	1	0	0	0	0	
		2	*	*	*	1	0	0	0	0	
		3	*	*	*	0	1	1	1	1	
		4	*	*	*	0	0	0	0	1

Symbol Register

The SED1234, 1235 provided with a symbol register that permits displaying each symbol so that symbol display may be performed on the screen.

The capacity of the symbol register is 48 bits. In case of 48 symbols can be displayed.

The relationship among symbol register display patterns, RAM addresses and write data is shown below.

RAM address	Symbol Bits								
	D7							D0	
70H~7BH	0	*	*	*	25	1	26	2	*
	1	*	*	*	27	3	28	4	*
	:	:							
	B	*	*	*	47	23	48	24	*

Bit
1: Display
0: Not display

- Notes:
1. We recommend to drive a symbol by dividing it into COMS2 and COMS3 separately if it is larger than other dots for 1.5 times or more.
 2. Do not cross a segment (other than those used for symbol display) with COMS2 or COMS3. If segment crossing is required, set the symbol registers of COMS3 to all zeros (0s).

ABSOLUTE MAXIMUM RATINGS

Item	Symbol	Standard value	Unit
Power supply voltage (1)	V _{SS}	-6.0~+0.3	V
Power supply voltage (2)	V ₅	-16.0~+0.3	V
Power supply voltage (3)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ +0.3	V
Input voltage	V _{IN}	V _{SS} -0.3~+0.3	V
Output voltage	V _O	V _{SS} -0.3~+0.3	V
Operating temperature	T _{opr}	-30~+85	°C
Storage temperature	TCP	T _{str}	°C
	Bare chip		
			-65~+125

- Notes:
1. All the voltage values are based on V_{DD} = 0 V.
 2. For voltages of V₁, V₂, V₃ and V₄, keep the condition of V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V₅ and V_{DD} ≥ V_{SS} ≥ V₅ ≥ V_{OUT} at all times.
 3. If the LSI is used exceeding the absolute maximum ratings, it may lead to permanent destruction. In ordinary operation, it is desirable to use the LSI in the condition of electrical characteristics. If the LSI is used out of this condition, it may cause a malfunction of the LSI and have a bad effect on the reliability of the LSI.

DC CHARACTERISTICS

V_{DD} = 0 V, V_{SS} = -3.6 V to -2.4 V, Ta = -30 to 85°C unless otherwise specified.

Item		Symbol	Condition	min	typ	max	Unit	Applicable pin	
Power supply voltage (1)	Recommended operation	V _{SS}		-3.6	-3.0	-2.4	V	V _{SS}	
	Operable			-5.5	-3.0	-2.4		*1

	Reference voltage (standard)	V _{REG}	Ta = 25°C	-3.5	-3.1	-2.7	V	*12	
Reference voltage (option)	V _{REG(VS1)}	Ta = 25°C	-2.4	-2.1	-1.8	V	*12		

*1: A wide operating voltage range is guaranteed but an abrupt voltage variation in the access status of the MPU is not guaranteed.

*2: The operating voltage range is applicable to the case where an external power supply is used.

*3: D0 ~ D5, D6 (SCL), D7 (SI), A0, RES, \overline{CS} \overline{WR} (E), P/S, IF

*4: This is a resistance value when a voltage of 0.1 V is applied between output pin SEG_n, SEG_S_n, COM_n or

COM_S_n, and each power pin (V₁, V₂, V₃ or V₄). It is specified in the range of operating voltage (2).

$$R_{ON} = 0.1 \text{ V} / \Delta I$$

(ΔI: Current flowing when 0.1 V is applied between the power and output)

*5: Character “” display. This is applicable to the

case where no access is made from the MPU and the built-in power circuit and oscillating circuit are in operation.

- *6: This is applicable to the case where the built-in power circuit is OFF and the oscillating circuit is in operation in the standby mode.
- *7: Current consumption when data is always written by f_{cyc} .
The current consumption in the access state is almost proportional to the access frequency (f_{cyc}).
When no access is made, only $I_{DD(I)}$ occurs.
- *8: t_R (reset time) indicates the internal circuit reset completion time from the edge of the RES signal. Accordingly, the SED123* usually enters the operating state after t_R .
- *9: Specifies the minimum pulse width of the RES signal. It is reset when a signal having the pulse width greater than t_{RW} is entered.
- *10: When operating the boosting circuit, the power supply V_{SS} must be used within the input voltage range.
- *11: The f_{OSC} frequency of the oscillator circuit for internal circuit drive may differ from the f_{BST} boosting clock on some models. The following provides the relationship between the f_{OSC} frequency, f_{BST} boosting clock, and f_{FR} frame frequency.

$$f_{OSC} = (\text{No. of digits}) \times (1/\text{Duty}) \times f_{FR}$$

$$f_{BST} = (1/2) \times (1/\text{No. of digits}) \times f_{OSC}$$
 Example: The SED1230 has 13 digits of display and 1/30 duty.

$$f_{OSC} = 13 \times 30 \times 100 = 39 \text{ kHz}$$

$$f_{BST} = (1/2) \times (1/13) \times 39 \text{ K} = 1.5 \text{ kHz}$$
- *12: The V_{REG} reference voltage has the temperature characteristics of approximately $-0.17\%/^{\circ}\text{C}$ (standard specifications). An optional model having the temperature characteristics of approximately $-0.04\%/^{\circ}\text{C}$ is also available. The CGROM modification rules apply to the optional models.

All signal timings are based on 20% and 80% of V_{SS} signals.

TIMING CHARACTERISTICS

(1) System Bus Write Characteristic I (80 series MPU)

[V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C unless otherwise specified]

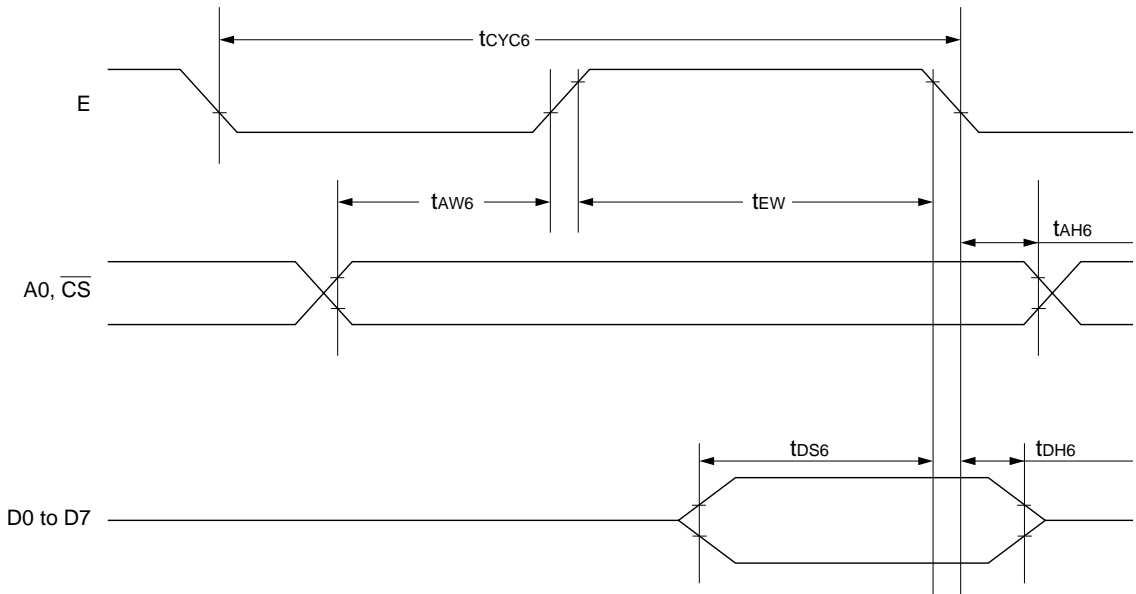

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
Address hold time	A0, \overline{CS}	t _{AH8}		30		ns
Address setup time	A0, \overline{CS}	t _{AW8}		60		ns
System cycle time	\overline{WR}	t _{CYC8}	V _{SS} = -3.0	500		ns
Control pulse width (\overline{WR})		t _{CC}	-2.7	550		ns
			-2.4	650		
			V _{SS} = -3.0	100		
Data setup time	D0 ~ D7	t _{DS8}	-2.7	120		ns
Data hold time	D0 ~ D7	t _{DH8}	-2.4	150		ns

*1: For the rise and fall of an input signal, set a value not exceeding 25 ns.

*2: Every timing is specified on the basis of 20% and 80% of V_{SS}.

*3: For A0 and \overline{CS} , the same time is not required. Input signals so that A0 and \overline{CS} may satisfy t_{AW8} and t_{AH8} respectively.

(2) System Bus Write Characteristic II (68 series MPU)

[V_{SS} = -3.6 V to -2.4 V, T_a = -30 to 85°C unless otherwise specified]

Item	Signal	Symbol	Measuring condition	Min.	Max.	Unit
System cycle time	A0, \overline{CS}	t _{CYC6}	V _{SS} = -3.0 -2.7 -2.4	500 550 650		ns
Address setup time		t _{AW6}		60		
Address hold time		t _{AH6}		30		ns
Data setup time	D0 ~ D7	t _{DS6}		100		ns
Data hold time		t _{DH6}		50		ns
Enable pulse width	E	t _{EW}	V _{SS} = -3.0 -2.7 -2.4	100 120 150		ns

- *1: t_{CYC6} denotes the cycle of the E signal in the \overline{CS} active state. t_{CYC6} must be reserved after \overline{CS} becomes active.
- *2: For the rise and fall of an input signal, set a value not exceeding 25 ns.
- *3: Every timing is specified on the basis of 20% and 80% of V_{SS}.
- *4: For A0 and \overline{CS} , the same timing is not required. Input signals so that A0 and \overline{CS} may satisfy t_{AW6} and t_{AH6} respectively.

LIQUID CRYSTAL DRIVE WAVEFORMS (B WAVEFORMS)

SED1234/35 Series

Instruction Setup Example (Reference Only)

(1) Initial setup

(2) Display mode

(Note 1)
(Note 1)

Note 1: Commands (6) and (7) initialize the RAM. The display contents must first be set. The non-display area must satisfy the following conditions (for RAM clear).

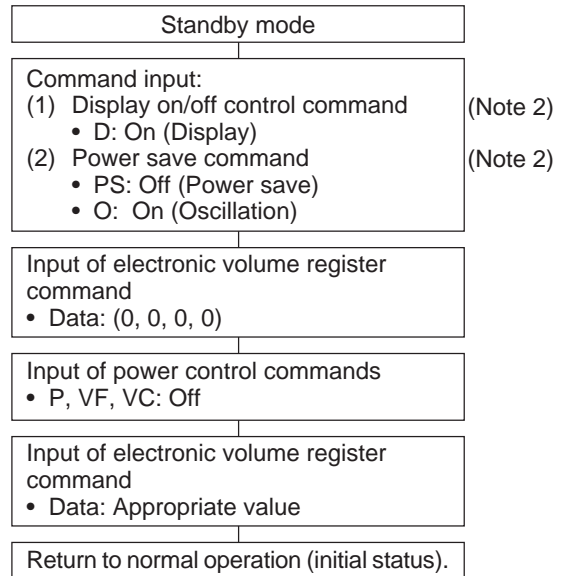

- DDRAM: Write the 20H data (character code).
- CGRAM: Write the 00H data (null data).
- Symbol register: Write the 00H data (null data).

As the RAM data is unstable during reset signal input (after power-on), null data must be written. If not, unexpected display may result.

(3-1) Selecting the Standby mode

(3-2) Releasing the Standby mode

Note 2: Commands (1) and (2) can be entered in any order. Also, command (1) is optional.

(4-1) Selecting the Sleep mode

(4-2) Releasing the Sleep mode

Note 3: Commands (1) and (2) can be entered in any order. Also, command (1) is optional.

OVERVIEW

The SED1240 Series is a character display dot matrix LCD controller driver. This driver can display up to 64 characters and 6 user-defined characters, and up to 160 symbols according to the 4-bit, 8-bit or serial data which is sent from a microcomputer.

The built-in character generator ROM is provided with up to 544 types of character fonts having a structure of 5 × 8 dots. Up to 256 types can be continuously called by register option selection. This can cope with many different character fonts by uses and countries and permits a wider range of use. This driver incorporates a user-defined character RAM for 6 characters of 5 × 8 dots and can be used for the display of higher degree of freedom by means of a symbol register.

The driver can operate handy units at the minimum power consumption by using its merit of lower power consumption, standby mode, and sleep mode.

FEATURES

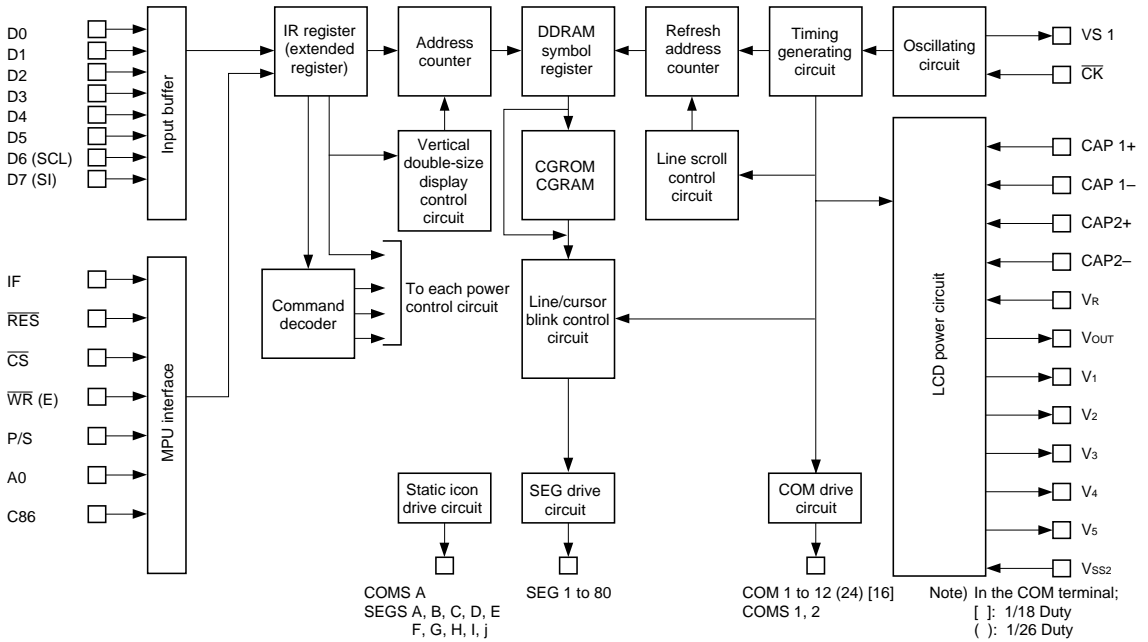

- Built-in display data RAM 80-character + 6-character user-defined characters + 160 symbols
- CGROM (for up to 544 characters), CGRAM (6 characters), symbol register (160 symbols)
- Display digits × Number of lines
 <Ordinary mode>
 - ① (16 digits) × 4 lines + 160 symbols + 10 static icons (SED1240)
 - ② (16 digits) × 3 lines + 160 symbols + 10 static icons (SED1241)
 - ③ (16 digits) × 2 lines + 160 symbols + 10 static icons (SED1242)
 <Standby mode>
 - ① 10 static icons (SED1240)
 - ② 10 static icons (SED1241)
 - ③ 10 static icons (SED1242)
- Vertical double-size display function
- Line vertical scroll function
- Line blink function
- Symbol blink function

- Built-in CR oscillating circuit (Built-in C, R)
- External clock input
- High-speed MPU interface
Interface with both MPUs of 68 series/80 series
Interface by 4 bits/8 bits
- Serial interface
- Character font 5 × 8 dots
- Duty ratio
 - ① 1/34 (SED1240)
 - ② 1/26 (SED1241)
 - ③ 1/18 (SED1242)
- Simple command setup
- Built-in liquid crystal drive power circuit
The boosting circuit, voltage regulating circuit, voltage follower × 4, and resistor for power regulating circuit for bias select commands are incorporated.
- Built-in electronic volume function
- Lower power consumption
 - 80 μA max (at ordinary operation (during display): Including the internal power supply operating current)
 - 500 μA max (at ordinary operation (during access): f_{cyc} = 200 KHz, including the internal power supply operating current)
 - 20 μA max (in standby mode: Oscillation ON, power OFF, static icon display)
 - 5 μA max (in sleep mode: oscillation OFF, power OFF, display OFF)
- Power supply:

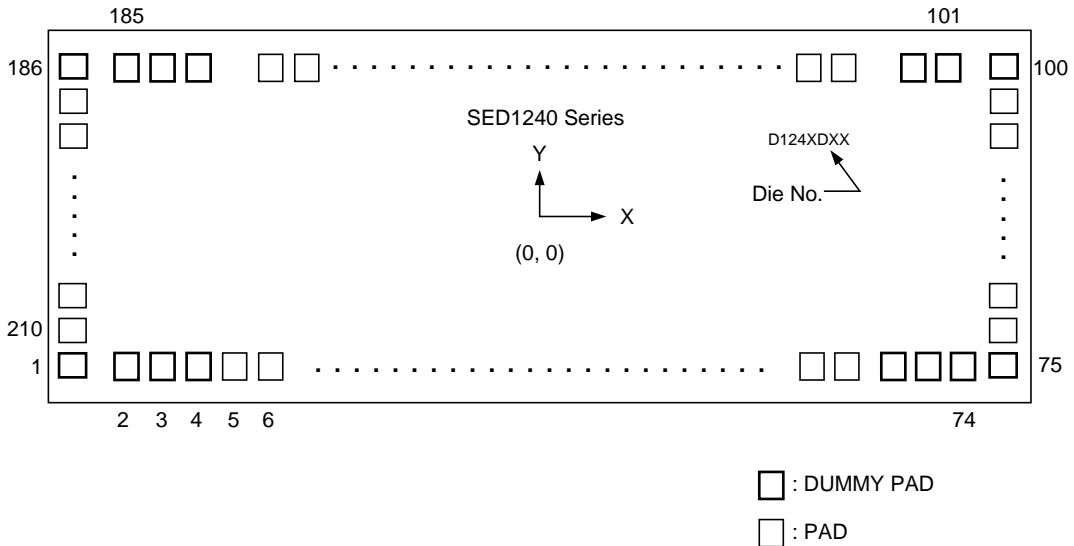

V _{DD} - V _{SS}	1.8 V to 5.5 V
V _{DD} - V _{SS2}	1.8 V to 5.5 V
V _{DD} - V ₅	5.5 V to 16.0 V
- Wide operating temperature range
T_a = -30 to +85°C
- CMOS process
- Pad pitch 90 μm Min
- Delivery form

Chip (gold bump product)	SED124*D**
TCP	SED124*T**
- This IC is not designed against radiation and strong light and noise.

SED1240 Series

(FS*) : This is a FUSE adjusting pin. Set it in the floating state.

CK pin : Fix it to VDD when it is not used.

*: Don't connect COM17 to COM32.

DESCRIPTION OF PINS

Power Pins

Pin name	I/O	Description	Q'ty									
Board potential		IC board is based on VDD potential. To lock the board potential with VDD.										
VDD	Power supply	Connected to the logic power supply. This is used in common with the MPU power pin Vcc.	6									
VSS	Power supply	0 V power pin that is connected to system GND.	4									
V0, V1 V2, V3 V4, V5	Power supply	Multi-level power supply for liquid crystal drive. The voltage determined for the liquid crystal cell is applied by resistance-division or impedance conversion by operational amplifier. The potential is determined on VDD and the following relations must be observed. $VDD = V0 \geq V1 \geq V2 \geq V3 \geq V4 \geq V5$ $VDD \geq V5 \geq VOUT$ $VDD \geq VSS \geq VSS2 \geq VOUT$ When the built-in power supply is ON, the following voltages are given to V1 to V4 by command selection. <table style="display: inline-table; vertical-align: middle;"> <tr> <td style="padding-right: 10px;">$V1 = 1/5 V5$</td> <td rowspan="4" style="font-size: 2em; vertical-align: middle;">}</td> <td style="padding-left: 10px;">$1/4 V5$</td> </tr> <tr> <td>$V2 = 2/5 V5$</td> <td style="padding-left: 10px;">$2/4 V5$</td> </tr> <tr> <td>$V3 = 3/5 V5$</td> <td style="padding-left: 10px;">$2/4 V5$</td> </tr> <tr> <td>$V4 = 4/5 V5$</td> <td style="padding-left: 10px;">$3/4 V5$</td> </tr> </table>	$V1 = 1/5 V5$	}	$1/4 V5$	$V2 = 2/5 V5$	$2/4 V5$	$V3 = 3/5 V5$	$2/4 V5$	$V4 = 4/5 V5$	$3/4 V5$	6
$V1 = 1/5 V5$	}	$1/4 V5$										
$V2 = 2/5 V5$		$2/4 V5$										
$V3 = 3/5 V5$		$2/4 V5$										
$V4 = 4/5 V5$		$3/4 V5$										
Vs1	O	Supply voltage output pin for oscillating circuit. Don't connect a load to the outside.	1									

LCD Power Circuit Pins

Pin name	I/O	Description	Q'ty
CAP1+	O	Boosting condenser positive side connecting pin. Condenser is connected with the CAP1- pin.	1
CAP1-	O	Boosting condenser negative side connecting pin. Condenser is connected with the CAP1+ pin.	1
CAP2+	O	Boosting condenser positive side connecting pin. Condenser is connected with the CAP2- pin.	1
CAP2-	O	A boosting condenser negative side connecting pin. Condenser is connected with the CAP2+ pin.	1
VOUT	O	Output pin for boosting. Smoothing condenser is connected with VDD.	1
VR	I	Voltage adjusting pin. Voltage between VDD and V5 is given by resistance-division.	1
VSS2	I	Boosting power pin. The voltage between VDD and VSS2 is boosted by a specified multiple.	1

System Bus Connecting Pins

Liquid Crystal Drive Circuit Signals

Dynamic Drive Pins [SED1240]

Pin name	I/O	Description	Q'ty
COM1 to COM32	O	Common signal output pins (for characters)	32
COMS1, COMS2	O	Common signal output pins (for others than characters) COMS1, COMS2: Symbol output command output	4
SEG1 to SEG80	O	Segment signal output pins (for characters)	80

Dynamic Drive Pins [SED1241]

Pin name	I/O	Description	Q'ty
COM1 to COM24	O	Common signal output pins (for characters)	16
COMS1, COMS2	O	Common signal output pins (for others than characters) CMOS1, CMOS2: Symbol display common output	4
SEG1 to SEG80	O	Segment signal output pins (for characters)	80

Dynamic Drive Pins [SED1242]

Pin name	I/O	Description	Q'ty
COM1 to COM16	O	Common signal output pins (for characters) (Keep COM17 to COM32 unconnected.)	16
COMS1, COMS2	O	Common signal output pins (for others than characters) CMOS1, CMOS2: Symbol display common output	4
SEG1 to SEG80	O	Segment signal output pins (for characters)	80

Static Drive Pins

Pin name	I/O	Description	Q'ty
COMSA	O	Common signal output pin (for static icons)	2
SEGS A to J	O	Segment signal output pins (for static icons)	10

Note: For the electrode of the liquid crystal display panel connected to the static drive terminal, it is recommended use the pattern separated from the electrode connected to the dynamic drive terminal. If this pattern is too close, the liquid crystal and electrode may be deteriorated.

DESCRIPTION OF FUNCTIONS

MPU Interfaces

In the SED1240 series, an MPU type, interface bit length and interface method can be selected depending on pins IF, P/S and C86.

Selection of MPU

In the SED1240 series, when parallel input is selected (P/S = “H”), pin C86 has an MPU selecting function. When either “H” or “L” is selected as the polarity of pin C86, the 80 series MPU or 68 series MPU can be selected as shown in Table 1.

Selection of an interface bit length (8 bits, 4 bits) is performed by pin IF.

Table 1

MPU type	Pin C86 state	Polarity of RES function input	MPU connection			
			A0	\overline{WR}	\overline{CS}	D0 to D7
68 series	High level	Low level active	A0	E	\overline{CS}	D0 to D7
80 series	Low level		A0	\overline{WR}	\overline{CS}	D0 to D7

Selection of interface type

In the SED1240 series, it is possible to select an 8-bit or 4-bit parallel interface or a serial interface that permits a data transfer through a serial input (SI). As the selecting method, set the polarity of pins of P/S and IF to “H” or “L”.

Table 2

Interface type	Interface bit length	Selecting pin state		Pin state										
		P/S	IF	\overline{CS}	A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
Parallel	8 bits	H	H	\overline{CS}	A0	\overline{WR}	D7	D6	D5	D4	D3	D2	D1	D0
Parallel	4 bits	H	L	\overline{CS}	A0	\overline{WR}	D7	D6	D5	D4	OPEN or H or L			
Serial	1 bit	L	H or L	\overline{CS}	A0	H or L	SI	SCL	OPEN or H or L					

Interface with 4-bit MPU

When data is transferred by a 4-bit interface (IF = 0), 8-bit commands, data and addresses are divided into 2 parts for transfer. A timing example of the 80 series MPU is shown below.

Note: For continuous writing, perform it after securing a time exceeding the system cycle time (t_{cyc}).

Serial interface (P/S = “L”)

The serial interface consists of an 8-bit shift register and a 3-bit counter, and becomes ready to accept an SI input or SCL input in the chip selected state (\overline{CS} = “L”).

Unless any chip is selected, the shift register and the counter are reset to the initial state. (Refresh state)

Data is input in the order of D7, D6, ..., D0 from the serial data input pin (SI) at the rise of the serial clock (SCL). At the rising edge of the 8th serial clock, the data is converted into parallel data.

Whether the serial data input (SI) is display data or a command is identified and judged by A0 input. When A0 = “H”, the data becomes display data. When A0 = “L”, the data becomes a command. The A0 input is read and identified at the rise of the 8 × nth serial clock (SCL) after chip selection.

Fig. 1 shows a timing chart of the serial interface. In case of the SCL signal, extreme care should be taken about terminal reflection and external noise due to a wiring length. Accordingly, it is recommended to make an operation check. It is also recommended to periodically refresh the each command write state to prevent a malfunction from being caused by noise.

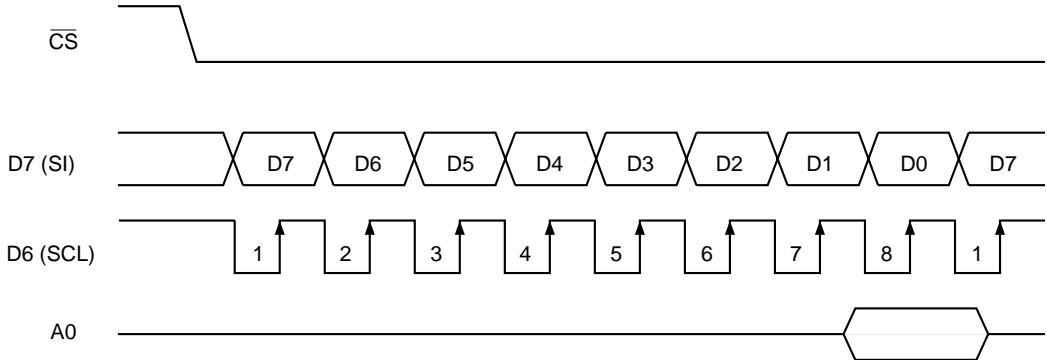

Fig. 1 Serial Interface Input Timing

Identification of data bus signals

The SED1240 series identifies each data bus signal by a combination of A0 and \overline{WR} (E) as shown in Table 3.

Table 3

Common	68 series	80 series	Function
A0	(E)	\overline{WR}	
1	1	0	Writes into the RAM and symbol register.
0	1	0	Writes into the internal register (commands)

Chip select

The SED1240 series has chip select pin \overline{CS} . Only when \overline{CS} = “L”, the MPU interface is enabled. In the other states than the chip select state, D0 to D7 and A0, \overline{WR} , SI, and SCL inputs are invalidated. When an serial input interface is selected, the shift register and the counter are reset. However, the RES input can be performed regardless of the \overline{CS} state.

Power Circuit

The power circuit built in the SED1240 series is a low power consumption power circuit that generates a voltage required for liquid crystal drive, and consists of a boosting circuit, voltage regulating circuit, and voltage follower.

The power circuit capacity is set for a small-scale liquid crystal panel.

In the case of a liquid crystal panel with a large display capacity, the display quality may be remarkably degraded. In this case, an external power supply is required.

Functional selection is performed by power control commands.

Some parts of the external power supply and the internal power supply can be used together.

Table 4

	Boosting circuit	Voltage regulating circuit	Voltage follower	External voltage input	Boosting system pin
	○	○	○	VSS2	USE
Note 1	×	○	○	VOUT, VSS2	OPEN
Note 2	×	×	○	V5, VSS2	OPEN
Note 3	×	×	×	V1, V2, V3, V4, V5	OPEN

Note 1: When the boosting circuit is turned off, set the boosting system pins (CAP1+, CAP1-, CAP2+, CAP2-) to OPEN so that liquid crystal drive voltages may be applied to the VOUT pin from the outside.

Note 2: When the voltage regulating circuit is not used with the boosting circuit OFF, set the VOUT pin and the boosting system pins to OPEN and connect the V5 pin to give liquid crystal drive voltages from the outside.

Note 3: When all the built-in power supplies are turned off, liquid crystal drive voltages V1, V2, V3, V4, and V5 are supplied from the outside and set the CAP1+, CAP1-, VSS2 and VOUT pins to OPEN.

Boosting circuit

The SED1240 series is provided with a boosting circuit for triple boosting and double boosting for the potential between VDD and VSS2.

For triple boosting, connect a capacitor between CAP1+ and CAP1-, between CAP2+ and CAP2-, and between VDD and VOUT, and the VDD - VSS2 potential is triple-booster to the negative side and output to the VOUT pin. For double boosting, connect a capacitor between CAP1+ and CAP1- and between VDD and VOUT, set CAP2+ to OPEN, and connect CAP2- to VOUT, and the VDD - VSS2

potential is double-booster to the negative side and output to the VOUT pin.

Because the boosting circuit uses signals from the oscillator output, the internal oscillating circuit or the external clock must be in operation.

The relation of boosting voltages is shown below.

Set the potential between the VDD and VSS2 to ensure that the VOUT does not exceed the permissible operating voltage range of VSS - VOUT (V5) when double or triple boosted.

Potential relation of triple boosting voltages

Potential relation of double boosting voltages

* Set the VSS2 voltage range to ensure that VOUT terminal voltage does not exceed the permissible operating voltage range of VSS - VOUT and absolute maximum rating.

Voltage regulating circuit

The boosting voltage generated at VOUT is output as a liquid crystal drive voltage of V5 through the voltage regulating circuit.

The SED1240 series is provided with a high-precision constant-voltage source, a 32-step electronic volume function, and a V5 voltage regulating resistor. This permits constructing a high-precision voltage regulating

circuit with a small quantity of parts. The voltage regulating circuit outputs VEV and has a temperature gradient of about -0.04%.

As the V5 voltage regulating resistor, a built-in resistor or an external resistor can be selected by command as a matter of configuration.

[When using an external resistor (No use of V5 voltage regulating built-in resistor is set by command.)]

The V5 voltage can be obtained from the following expression ① by adjusting resistors Ra and Rb within the range of |V5| < |VOUT|.

$$V5 = \left(1 + \frac{Rb}{Ra}\right) \cdot VEV \dots\dots\dots ①$$

In this case, VEV is determined by the constant-voltage source in the IC and by setting the electronic volume. When the electronic volume value is (00000), VREG ≒ 2.0 V, being constant.

For voltage adjustment of V5 output, connect a variable resistor among VR, VDD, and V5. For fine voltage adjustment of V5 output, it is recommended to combine fixed resistors R1 and R3 with variable resistor R2.

[R1, R2 and R3 setup example]

- R1 + R2 + R3 = 1.2 MΩ (Determined by the current value I05 flowing between VDD and V5. Supposing I05 ≤ 5 μA)
- Minimum voltage of V5: -6 V (Determined by liquid crystal characteristic)
- Variable voltage range by R2: -4 to -6 V (Determined by the liquid crystal characteristic)
- When the electronic volume register is set to (0, 0, 0, 0, 0), VEV = 2.0 V (TYP). Accordingly, each resistor value can be calculated by the above conditions and expression ① as follows.

- R1 = 400 KΩ
- R2 = 200 KΩ
- R3 = 600 KΩ

Note 1: The input impedance of the VR pin is high, so it is necessary to take a proper measure against noise for short wiring and shielding wiring.

[When using the V5 voltage regulating built-in resistor (Use of V5 voltage regulating built-in resistor is set by command.)]
 When the V5 voltage regulating built-in resistor and the electronic volume function are used, the liquid crystal supply voltage V5 can be controlled and the density of liquid crystal display can be controlled by commands only without adding any external resistor.

The V5 voltage can be obtained by the following expression ② by adjusting resistors Ra and Rb within the range of $|V5| < |VOUT|$.

$$V5 = \left(1 + \frac{Rb}{Ra}\right) \cdot VEV \dots\dots\dots ②$$

In this case, VEV is determined by the constant-voltage source within the IC and by setting the electronic volume. When the electronic volume value is (00000), VREG ≅ 2.0 V, being constant.

The voltage range of the V5 output can be adjusted by changing the built-in resistor ratio $(1 + Rb/Ra)$ by command. Reference values are shown in Table 5 and Fig. 2.

Table 5 V5 voltage regulating built-in resistor ratio set values (reference values)

Command		$(1 + Rb/Ra)$
IR1	IR0	
0	0	2.81
0	1	3.27
1	0	3.72
1	1	4.21

V5 voltage by V5 voltage regulating built-in resistor ratio set value and electronic volume resistor value (reference value)
 [Fig. 2]

Fig. 2

- Voltage regulating circuit using the electronic volume function
 When the electronic volume function is used, the liquid crystal drive voltage V5 can be controlled by the command to adjust the density of liquid crystal display. Regarding this method, set 5-bit data in the electronic

volume register, and the liquid crystal drive voltage V5 can take one of 32 states of voltage value. When the electronic volume function is used, the voltage regulating circuit must be turned on by the power control command.

[Constant setup example when using the electronic volume function]

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV}$$

However: $V_{EV} = V_{REG} - \alpha$

$$\alpha = V_{REG} / 150$$

Table 6

No.	Electronic volume register	α	V5
0	(0, 0, 0, 0, 0)	0	Large
1	(0, 0, 0, 0, 1)	1α	•
2	(0, 0, 0, 1, 0)	2α	•
3	(0, 0, 0, 1, 1)	3α	•
•	•	•	•
•	•	•	•
30	(1, 1, 1, 1, 0)	$n-1\alpha$	•
31	(1, 1, 1, 1, 1)	$n\alpha$	Small

When the electronic volume function is not used, set the electronic volume register to (0,0,0,0,0).

Liquid crystal voltage generating circuit

The V5 potential is resistance-divided by the built-in resistor of the IC or external resistors Ra and Rb, generating potentials V1, V2, V3, and V4 required for liquid crystal drive. Furthermore, potentials V1, V2, V3, and V4 are impedance-converted by the voltage follower and supplied to the liquid crystal drive circuit.

Regarding the liquid crystal drive voltage, the 1/5 bias or 1/4 bias can be selected by command. For liquid crystal power pins, capacitors C2 for voltage stabilization must be connected to pins V1 to V5 externally.

A reference circuit example of each case is shown below.

① Using all of the boosting circuit, power regulating circuit, and voltage follower

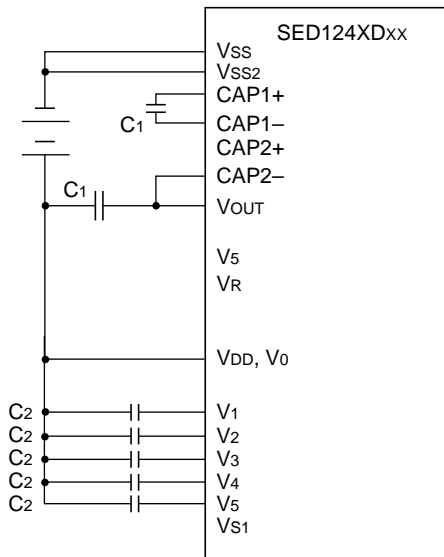

[When using a V5 voltage regulating built-in resistor]
(Example of Vss2 = Vss, triple boosting)

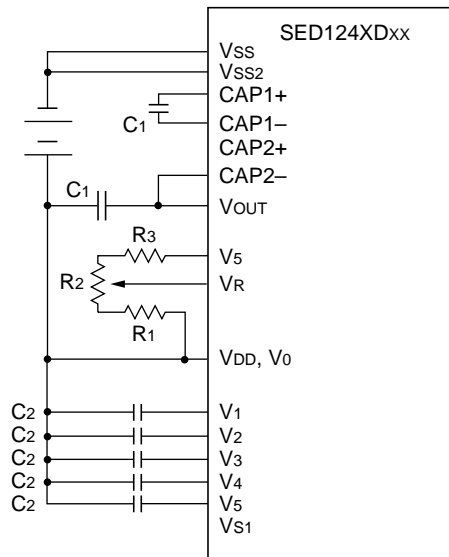

[When using no V5 voltage regulating built-in resistor]
(Example of Vss2 = Vss, triple boosting)

(Example of Vss2 = Vss, double boosting)

(Example of Vss2 = Vss, double boosting)

Reference set values: C1: 0.47 to 4.7 μF It is recommended to set optimum values suitable for the panel size in capacitors C1 and C2 while watching the liquid crystal display and drive waveforms.

② Using only the voltage regulating circuit and the voltage follower.

[When using a V₅ voltage regulating built-in resistor]
(Example of V_{SS2} = V_{SS})

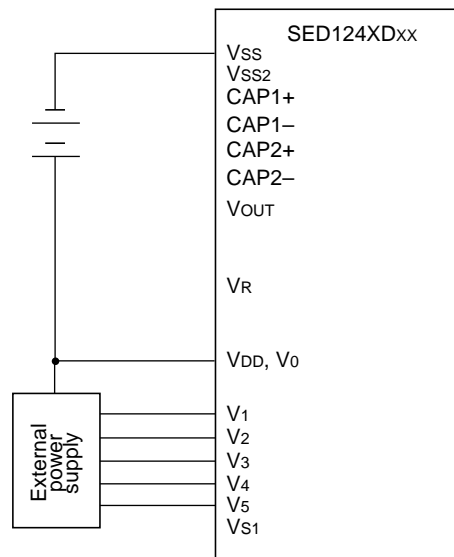

(Example of V_{SS2} = V_{SS})

[When using no V₅ voltage regulating built-in resistor]
(Example of V_{SS2} = V_{SS})

(Example of V_{SS2} = V_{SS})

Reference set values: C1: 0.47 to 4.7 μ F It is recommended to set optimum values suitable for the panel size in
C2: 0.1 to 4.7 μ F capacitors C1 and C2 while watching the liquid crystal display and drive waveforms.

*1 Because the input impedance of the V_R pin is high, use a short wire and a shielding wire.

*2 Determine C1 and C2 values depending on the size of the LCD panel to be driven. Set proper values that permit stabilizing the liquid crystal drive voltages.

- [Setting example]
- Turn on the voltage regulating circuit and the voltage follower and give a voltage to V_{OUT} from the outside.
 - Display a LCD heavy load pattern like horizontal stripes and determine a C2 value so that the liquid crystal drive voltages (V₁ to V₅) may be stabilized. However, it is necessary to set the same capacity value in C2 in every case.
 - Next, turn on the built-in power supply and determine a C1 value.

High power mode

The power circuit built-in the SED1240 series is a low power consumption type. (when the high power mode is OFF)

Accordingly, in the case of a large load liquid crystal or panel, the display quality may be degraded. In this case, the display quality can be improved by entering HPM = '1' by command. Before determining whether or not to use this mode, it is recommended to make a display check with a real machine.

In case the display quality cannot be improved satisfactorily though the high power mode is set, a liquid crystal drive power must be supplied from the outside.

Low Power Consumption Mode

The SED1240 series is provided with the standby mode/sleep mode to attain low power consumption in the standby status of the unit.

● Standby mode

The standby mode is turned on and off by the power save command and display off/booster circuit off command. Only static icons can be displayed.

- Liquid crystal display output
COM1 to COM32, COMS1, COMS2: VDD level
SEG1 to SEG80: VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA: Can be caused to come on by static drive.
Control the static icon display by SEGSA, B, C, D, E, F, G, H, I, J, COMSA by the static icon RAM.
- Contents of DDRAM, CGRAM, and symbol register
The written contents are kept in memory regardless of the ON/OFF status of the standby mode.
- The operation mode remains in the status provided before execution of the standby mode. The internal circuit for dynamic display output is stopped.
- Oscillating circuit
For static display, the oscillating circuit must be ON.

● Sleep mode

Turn off the power circuit and the oscillating circuit, set '0' in all the data of the static icon register, and execute the power save command.

Then, the sleep mode is set and the current consumption can be reduced to a value close to the static current.

- Liquid crystal display output
COM1 to COM32, COMS1, COMS2: VDD level
SEG1 to SEG80, SEGSA, 2, 4, 5: VDD level
SEGSA, B, C, D, E, F, G, H, I, J, COMSA: Set '0' in all the data of the static icon register and blink ON/OFF (for static icons).
- Contents of SSRAM, CGRAM and symbol register
The written contents can be kept in memory regardless of the ON/OFF status of the sleep mode.
- The operation mode remains in the status provided before execution of the sleep mode. All the internal circuits are stopped.
- Power circuit and oscillating circuit
Turn off the built-in power supply and oscillating circuit by the power save command and the power control command.

* Caution: If the oscillating circuit is stopped with the static icon register data and blinking kept off, previous display will remain on the icon. To avoid this, be sure to turn off the data and blinking before stopping the oscillating circuit.

Reset Circuit

When the $\overline{\text{RES}}$ input becomes active, this LSI will be put into the initial setup status. Resetting is performed at the 'L' level of the RES input signal.

● Initial setup status

- Line scroll register
LS1, 0 = 0 : Scroll amount 0 line
- Line blink control
LB4 = 0 : DDRAM line 4 blink OFF
LB3 = 0 : DDRAM line 3 blink OFF
LB2 = 0 : DDRAM line 2 blink OFF
LB1 = 0 : DDRAM line 1 blink OFF
- Vertical double-size display register
DD4 = 0 : Line 4 is displayed in standard form.
DD3 = 0 : Line 3 is displayed in standard form.
DD2 = 0 : Line 2 is displayed in standard form.
DD1 = 0 : Line 1 is displayed in standard form.
- Display ON/OFF register
C = 0 : Cursor OFF
B = 0 : Blink OFF
D = 0 : Display OFF
RE = 0 : Extended register OFF
- Power save register
O = 0 : Oscillating circuit OFF
PS = 0 : Power save OFF
- Power control register
HPM = 0 : High power mode OFF
VC = 0 : Voltage regulating circuit OFF
VF = 0 : Voltage follower OFF
P = 0 : Boosting circuit OFF
IRS = 1 : For built-in resistor
BAS = 0 : 1/5 bias
IR1,0 = 00 : Rb/Ra = small
- System set register
CG = 0 : CGRAM not used
CS = 0 : Left shift
SS = 0 : Normal display
R1, 0 = 0 : Standard ROM + OPTION ROM1
- Electronic volume
(0,0,0,0,0)
- Static icon ON/OFF control
(SEGSA, B, C, D, E, F, G, H, I, J) =
(0,0,0,0,0,0,0,0,0,0): Display OFF
- Static icon blink control
(SEGSA, B, C, D, E, F, G, H, I, J) =
(0,0,0,0,0,0,0,0,0,0): Blink OFF

As seen in MPU Interface, the RES pin inputs data at the same timing as MPU resetting and performs initialization concurrently with the MPU. However, if this pin is put into the high impedance for a certain period after the MPU bus and ports are reset, perform a reset input after the input to the SED1240 series is definitively set.

For the reset signal, it is necessary to input '0' level

pulses at least for 10 μ s as described in DC Characteristics. The ordinary operation will be started in 1 μ s or more after the rising edge of the RES signal. When the RES pin becomes active, each register will be cleared and set to the above setup status.

If initialization is not executed by the RES pin when the supply voltage is applied, a clear disable status may appear.

In case the built-in liquid crystal power circuit is not used, the RES input must be active when the external liquid crystal power supply is turned on.

DESCRIPTION OF COMMANDS

Table 7 shows a command table. The SED1240 series identifies each data/command by a combination of A0 and \overline{WR} (E).

An extended command can be selected by the RE bit in the command.

Interpreting and executing commands are performed only at the internal timing. This permits high-speed processing.

Overview of Commands

Table 7

Command type	Command name	RE	A0	\overline{WR}
Display control instructions	Cursor Home	0	0	0
	Display ON/OFF Control	0/1	0	0
	Line Blink Control	0	0	0
	Line Scroll Control	1	0	0
	Static Icon Display Control	0	1	0
	Static Icon Display Blink Control	0	1	0
	Vertical Double-size Display Control	1	0	0
Power control	Power Save	0/1	0	0
	Power Control (1)	0	0	0
	Power Control (2)	1	0	0
	Electronic Volume Control	0	1	0
System set	System Set (1)	0	0	0
	System Set (2)	1	0	0
Address control instructions	DDRAM, Symbol Register	0	0	0
	CGRAM	1	0	0
Data input instruction	Data Write	0/1	1	0

The execution time of each instruction is determined by the internal processing time of the SED1240 series.

Accordingly, for executing an instruction, secure a time exceeding the cycle time (tcyc) and then execute the instruction.

Table 8 SED1240 Series Command Table

Command	Code											Function														
	RE	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0															
(1) Cursor Home/Line Scroll Control	0	0	0	0	0	0	1	*	*	*	*	Moves the cursor to the home position. (Set the address to 30H.)														
	1	0	0	0	0	0	1	*	*	LS1	LS0	Specifies the number of display scrolls in units of line. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>LS1</th> <th>LS0</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Scroll amount 0 line</td> </tr> <tr> <td>0</td> <td>1</td> <td>One-line upward scroll</td> </tr> <tr> <td>1</td> <td>0</td> <td>Two-line upward scroll</td> </tr> <tr> <td>1</td> <td>1</td> <td>Three-line upward scroll</td> </tr> </tbody> </table>	LS1	LS0	Function	0	0	Scroll amount 0 line	0	1	One-line upward scroll	1	0	Two-line upward scroll	1	1

0	1	Standard ROM + OPTION ROM2																									
1	0	Standard ROM + OPTION ROM3																									
1	1	Standard ROM + OPTION ROM4																									
1	0	0	0	1	1	0	*	*	SS	*	Sets the normal/reverse display (SS) of each segment character. SS = 1 (reverse) SS = 0 (normal)																
(7) RAM Address Set	0	0	0	1	ADDRESS						Sets the address of DDRAM, static icon RAM or electronic volume RAM.																
	1	0	0	1	ADDRESS						Sets the address of CGRAM or symbol register RAM.																

Command	Code											Function		
	RE	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0			
(8) RAM Data Write	0/1	1	0	DATA										Writes data into the DDRAM, CGRAM, symbol register RAM, static icon RAM or electronic volume RAM. This is determined by the address set instruction executed immediately before writing data.
(9) NOP	0/1	0	0	0	0	0	0	0	0	0	0	0	A command for NON-OPERATION. This also serves as a test mode clear command, so it is recommended to input it periodically.	
(10) Test Mode	0/1	0	0	0	0	0	0	*	*	*	*	A command for IC chip test. Don't use this command.		

Description of Command Functions

Cursor home

Function: Presets the address counter to 30H. Only when the previous RAM access is made to the area of RE = 0 of the RAM map, the cursor is moved to digit 1 on line 1 if the cursor is displayed.
If line scroll is set, it is cleared to the scroll amount = 0 line.

RE	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	1	*	*	*	*

* : Don't Care

Line scroll control

Function: Controls the display scroll amount for each line.

RE	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	0	0	1	*	*	LS1	LS0

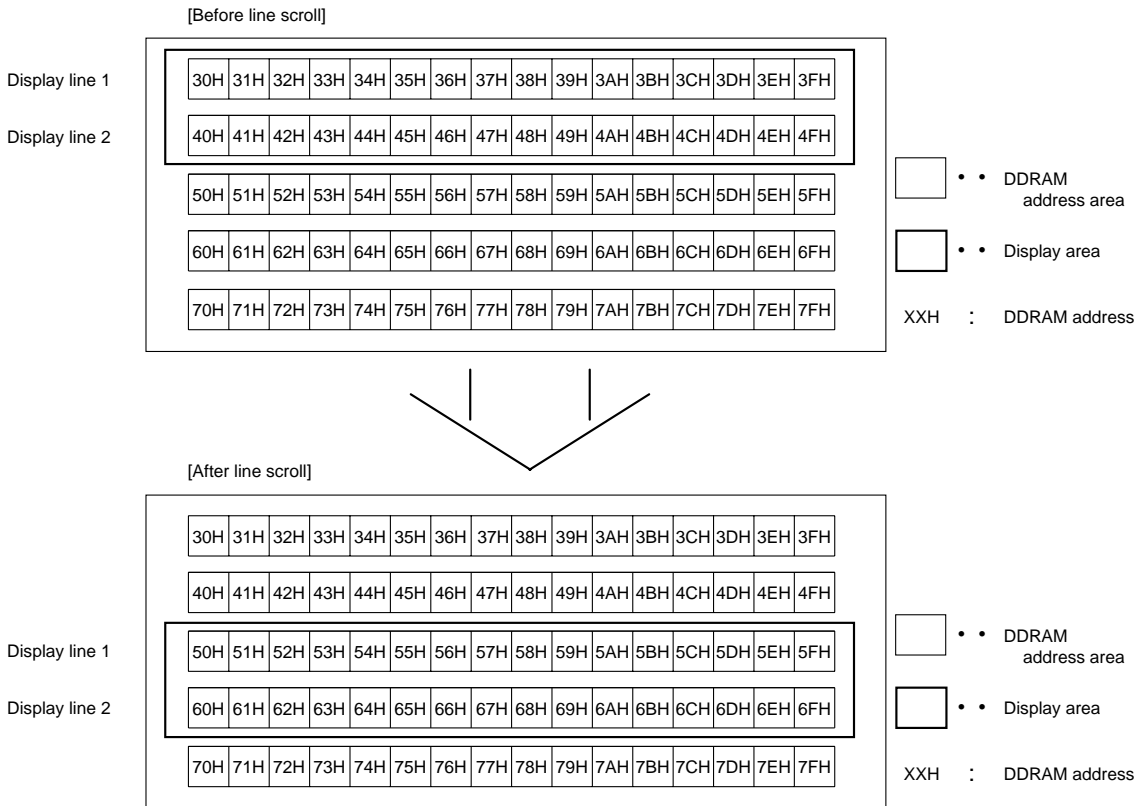

* : Don't Care

LS1	LS0	Function
0	0	Scroll amount 0 line
0	1	Scrolls 1 line upward. (display line 1 from DDRAM line 2)
1	0	Scrolls 2 lines upward. (display line 1 from DDRAM line 3)
1	1	Scrolls 3 lines upward. (display line 1 from DDRAM line 4)

- When 2-line scroll has been performed upward at the 4-line display

- When 2-line scroll has been performed upward at the 2-line display [(LS1, LS2) = (1, 0)]

Line blink display control

Function: Displays the specified line in black-and-white reverse form.
The specified line corresponds to the address line of the DDRAM.
(Not the display line)

RE	A0	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	1	0	LB4	LB3	LB2	LB1

- Displays the specified line of the DDRAM in black-and-white form by setting LB4 to LB1.
 - LB4 = 0 : Displays the data for line 4 of the DDRAM in standard form. (no blink)
[DDRAM 60H to 6FH]
 - LB4 = 1 : Displays the data for line 4 of DDRAM in black-and-white reverse blink form.
[DDRAM 60H to 6FH]
 - LB3 = 0 : Displays the data for line 3 of the DDRAM in standard form. (no blink)
[DDRAM 50H to 5FH]

- LB3 = 1 : Displays the data for line 3 of the DDRAM in black-and-white reverse blink form.
[DDRAM 50H to 5FH]
- LB2 = 0 : Displays the data for line 2 of the DDRAM in standard form. (no blink)
[DDRAM 40H to 4FH]
- LB2 = 1 : Displays the data for line 2 of the DDRAM in black-and-white reverse blink form.
[DDRAM 40H to 4FH]
- LB1 = 0 : Displays the data for line 1 of the DDRAM in standard form. (no blink)
[DDRAM 30H to 3FH]
- LB1 = 1 : Displays the data for line 1 of the DDRAM in black-and-white reverse blink form.
[DDRAM 30H to 3FH]

- fBLINK = 1 to 2Hz.
- Blinking is performed at the same frequency as cursor blink.
If blinking is caused to occur at the same time, the cursor position will be hard to know.

Vertical double-size display control

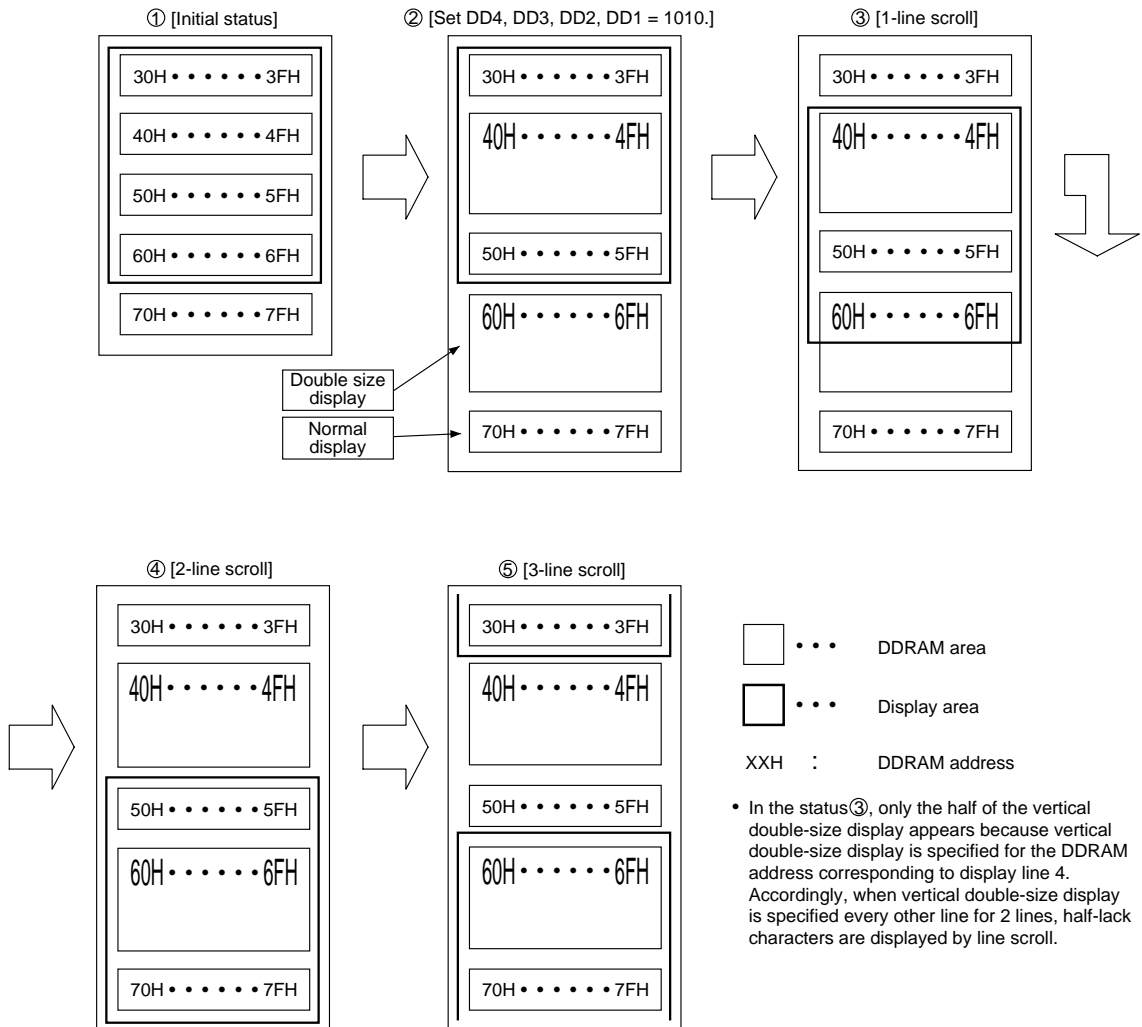

Function: Displays the specified line in vertical double-size form.
 The specified line corresponds to the address of the DDRAM.
 (Not the display line)

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	0	1	0	DD4	DD3	DD2	DD1

- Displays the specified line of the DDRAM in vertical double-size form by setting DD4 to DD1.
 - DD4 = 0 : Displays the data for line 4 of the DDRAM in standard form. [DDRAM 60H to 6FH]
 - DD4 = 1 : Displays the data for line 4 of the DDRAM in vertical double-size form. [DDRAM 60H to 6FH]

- DD3 = 0 : Displays the data for line 3 of the DDRAM in standard form. [DDRAM 50H to 5FH]
- DD3 = 1 : Displays the data for line 3 of the DDRAM in vertical double-size form. [DDRAM 50H to 5FH]
- DD2 = 0 : Displays the data for line 2 of the DDRAM in standard form. [DDRAM 40H to 4FH]
- DD2 = 1 : Displays the data for line 2 of the DDRAM in vertical double-size form. [DDRAM 40H to 3FH]
- DD1 = 0 : Displays the data for line 1 of the DDRAM in standard form. [DDRAM 30H to 3FH]
- DD1 = 1 : Displays the data for line 1 of the DDRAM in vertical double-size form. [DDRAM 30H to 3FH]

- Example of vertical double-size display
An example of 4-line display will be cited for explanation.

- Example of vertical double-size display (characters)

[Standard display]

[Vertical double-size display]

When the under-bar cursor is displayed, this will also be of double-size.

Display ON/OFF control

Function: Sets both display and cursor ON/OFF, and extended register access.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0/1	0	0	0	0	1	1	C	B	RE	D

- Display ON/OFF is specified by setting D.
 - D = 0 : Display ON
 - D = 1 : Display ON
- Character blink ON/OFF at the cursor position is specified by setting B. However, when the cursor is OFF, this bit is invalidated.
 - B = 0 : Cursor blink OFF
 - B = 1 : Cursor blink ON
- Cursor ON/OFF is specified by setting C.
 - C = 0 : No display of cursor
 - C = 1 : Display of cursor

- Extended register access is specified by setting RE.
 - RE = 0 : Extended register OFF
 - RE = 1 : Extended register ON
- The relation between C/B register and cursor display is shown in the following table.

C	B	Cursor display
0	0	No display (fixed)
0	1	No display (fixed)
1	0	Display of under-bar cursor
1	1	Alternate display of display characters and black-and-white reversed display characters

- Example of cursor display

The cursor display position is indicated by the address counter. Accordingly, when moving the cursor, change the address counter value by the RAM address set command or the auto increment by the RAM data write command.

To display the under-bar cursor when character data (CGRAM) at the cursor position, the position corresponding to the cursor position will be displayed in black-and-white reverse form.

If the address counter is set to the symbol register position at (C, B) = (1, 1), symbols can be caused to blink selectively (every 5 dots because symbols correspond to characters).

Power save

Function: Controls the oscillating circuit and sets and resets the power save mode and the sleep mode.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0/1	0	0	0	1	0	0	*	*	O	PS

* : Don't Care

- Power save mode ON/OFF is specified by setting PS.
 - PS = 0 : Power save OFF (reset)
 - PS = 1 : Power save ON (set)
- Oscillating circuit ON/OFF is specified by setting O.
 - O = 0 : Oscillating circuit OFF (stop of oscillation)
 - O = 1 : Oscillating circuit ON (start of oscillation)

Power control (1)

Function: Controls the operation of the built-in power circuit.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	0	1	HPM	VC	VF	P

* : Don't Care

- Boosting circuit ON/OFF is specified by setting P.
For operating the boosting circuit, the oscillating circuit must be in operation.
P = 0 : Boosting circuit OFF
P = 1 : Boosting circuit ON
- Voltage follower ON/OFF is specified by setting VF.
VF = 0 : Voltage follower OFF
VF = 1 : Voltage follower ON
- Voltage regulating circuit ON/OFF is specified by setting VC.
VC = 0 : Voltage regulating circuit OFF
VC = 1 : Voltage regulating circuit ON.
- High power mode ON/OFF is specified by setting HPM.
HPM = 0 : High power mode OFF
HPM = 1 : High power mode ON

Power control (2)

Function: Controls the operation of the built-in power circuit.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	1	0	1	IRS	BAS	IR1	IR0

* : Don't Care

- The relation of IR0 and option combinations is shown in the following table.

IR1	IR0	(1 + Rb/Ra)
0	0	Small
0	1	↓
1	0	
1	1	Large

- Bias selection is performed by setting BAS.
BAS = 0 : 1/5 bias
BAS = 1 : 1/4 bias
- Either built-in V5 voltage regulating resistor or external resistor (no use of built-in resistor) is selected by setting IRS.
IRS = 0 : No use of built-in resistor
IRS = 1 : Use of built-in resistor

System set (1)

Function: Selects an option ROM and sets the common shift direction and the use/no use of CGRAM.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	1	1	0	R1	R0	CS	CG

- The relation of R1 and R0 combinations is shown in the following figure.

R1	R0	ROM combination
0	0	Standard ROM (160 characters or 154 characters) + option ROM1 (96 characters)
0	1	Standard ROM (160 characters or 154 characters) + option ROM2 (96 characters)
1	0	Standard ROM (160 characters or 154 characters) + option ROM3 (96 characters)
1	1	Standard ROM (160 characters or 154 characters) + option ROM4 (96 characters)

- The COM shift direction is specified by setting CS.
CS = 0 : COM left shift
(COM1 → COM32 → COMS1 → COMS2)
CS = 1 : COM right shift
(COM32 → COM1 → COMS1 → COMS2)
- The use/no use of CGRAM is specified by setting CG.
CG = 0 : No use of CGRAM
CG = 1 : Use of CGRAM

System set (2)

Function: sets the normal/reverse display of SEG characters.
This function operates for each character.

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	1	1	0	*	*	SS	*

* : Don't Care

- The normal/reverse display of SEG is specified by setting SS.
SS = 0 : Normal display of SEG
SS = 1 : Reverse display of SEG
- For the symbol register RAM output, only the normal display is available.

- Example of display (compared by the same mounting method)

RAM address set (1) [DDRAM, static icon RAM, electronic volume RAM]

Function: Sets the address for writing data into the DDRAM, static icon RAM (including blink control), and electronic volume RAM in the address counter. When the cursor appears, it is displayed at the display position corresponding to the DDRAM address set by this command. (When the static icon RAM or electronic volume RAM is specified, the cursor disappears on the display.)

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	ADDRESS						

- ① The settable address is the address 00H to 7FH in D6 to D0.
- ② When writing data in the RAM, set the address for writing data by this command. Next, when data is written in succession, the address will be automatically incremented. (00H to 7FH → 00H)
- ③ RE = 0, 09H is for testing. Be sure not to use it!

RAM address set (2) [CGRAM, symbol register RAM]

Function: Sets the address for writing data into the CGRAM or symbol register RAM in the address counter. When the CGRAM address is set, the cursor will disappear on the display. When the symbol register RAM is set, the cursor moves to the corresponding symbol position, causing this symbol to blink selectively. When the cursor home command is executed immediately after execution of this instruction (before execution of RAM Address Set (1)), the cursor will not be displayed. (Because the address is set at address 30H of RE-1 of the RAM map.)

RE	A0	$\overline{\text{WR}}$	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	1	ADDRESS						

- ① The settable address of the address of 00H to 7FH in D6 to D0.
- ② When writing data in the RAM, set the address for writing data by this command. Next, if data is written in succession, the address will be automatically incremented. (00H to 7FH → 00H)
- ③ RE = 1, 30H - 5FH i8s set to No Use. It is not available.

<Example of Address Set>

[SED1240 RAM map] (4-line 16-digit display)

[Display range of each master]

The following shows the display range for the DDRAM area when the vertical double size is unspecified and scroll amount is 0 line:

SED1240 (4 lines by 16 columns)	1st line on display	RE = 0	30H to 3FH
	2nd line on display	RE = 0	40H to 4FH
	3rd line on display	RE = 0	50H to 5FH
	4th line on display	RE = 0	60H to 6FH
SED1241 (3 lines by 16 columns)	1st line on display	RE = 0	30H to 3FH
	2nd line on display	RE = 0	40H to 4FH
	3rd line on display	RE = 0	50H to 5FH
SED1242 (2 lines by 16 columns)	1st line on display	RE = 0	30H to 3FH
	2nd line on display	RE = 0	40H to 4FH

RAM data write

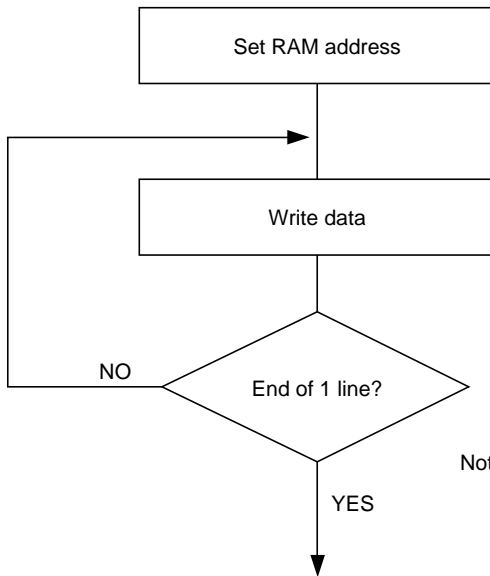

Function: Writes data in the RAM areas of the DDRAM, CGRAM, symbol register RAM, static icon RAM, and electronic volume RAM.
 Before this command, be sure to execute the address set command.
 After that, each time data is written, the address will be automatically incremented.
 (Regarding the RE bit, the contents set by the command will be kept in memory.)

- ① Data is written into the DDRAM, CGRAM, symbol register RAM, static icon RAM, or electronic volume RAM.
- ② The address counter is automatically incremented by 1, so data can be written in succession. However, the address counter advances from 00H to 7FH to 00H. Accordingly, when writing data into the CGRAM, take care not to write it at the addresses subsequent to 30H.

0/1	1	0	DATA							

<Data write example>

An example of writing one line of data into the DDRAM continuously is shown below.

Note: Before executing instructions in succession, secure a time exceeding t_{CYC} and then execute them.

NOP

Function: A no-operation command. No operation is performed functionally. However, because a test mode reset function exists inside, the test mode can be reset if the IC is put into this mode by an effect of noise.
 It is recommended to add this command at each breakpoint of the program.

Test mode

Function: An IC test mode set command. Don't use it in any case.

CHARACTER GENERATOR

Character Generator ROM (CGROM)

The SED1240 series is provided with a character generator ROM consisting of up to 544 types of characters. Each character size is of a structure of 5×8 dots.

A character code table of the SED1240 series is shown in CGROM Table X to X. In this case, which of CGROM and CGRAM should be used for the 6 characters of 00H to 05H of the character code is specified by the system set command.

The CGROM of the SED1240 series is a mask ROM and is compatible with the user's own CGROM. Please ask our sales department for further information. Regarding a changed product of CGROM, the product name is defined as follows:

Example: SED1240DAB

↑

Character Generator RAM (CGRAM)

The SED1240 series is provided with a CGROM that permits the user to program character patterns so as to attain a character display with a high degree of freedom. When using the CGRAM, select Use of CGRAM by the system set command. The CGRAM capacity is 240 bits having a structure of 5 × 8 dots and optional 6 types of patterns can be registered.

The relation among CGRAM character patterns, CGRAM addresses, and character codes is shown below.

Character code	RAM Address (CGRAM selection: RE = 1)	CGRAM data (character pattern)					SEG	Character display			
		D7				D0					
00H 02H 04H	(00H to 07H) (10H to 17H) (20H to 27H)	0	*	*	*	0	1	1	1	1	
		1	*	*	*	1	0	0	0	0	
		2	*	*	*	1	0	0	0	0	
		3	*	*	*	0	1	1	1	1	
		4	*	*	*	0	0	0	0	1	
		5	*	*	*	0	0	0	0	1	
		6	*	*	*	1	1	1	1	0	
		7	*	*	*	0	0	0	0	0	
01H 03H 05H	(08H to 0FH) (18H to 1FH) (28H to 2FH)	8	*	*	*	0	0	1	0	0	
		9	*	*	*	0	0	1	0	0	
		A	*	*	*	0	1	1	1	0	
		B	*	*	*	0	1	1	1	0	
		C	*	*	*	0	1	1	1	0	
		D	*	*	*	1	1	1	1	1	
		E	*	*	*	1	1	1	1	1	
		F	*	*	*	0	0	0	0	0	

Unused		Character data			

1: Display
0: No display

The character size of 5 × 8 can also be set. In this case, use the RAM of *7H, *FH of the CGRAM address. However, when the under-bar cursor is used, the data of *7H, *FH is displayed in reverse form.

Symbol Register RAM

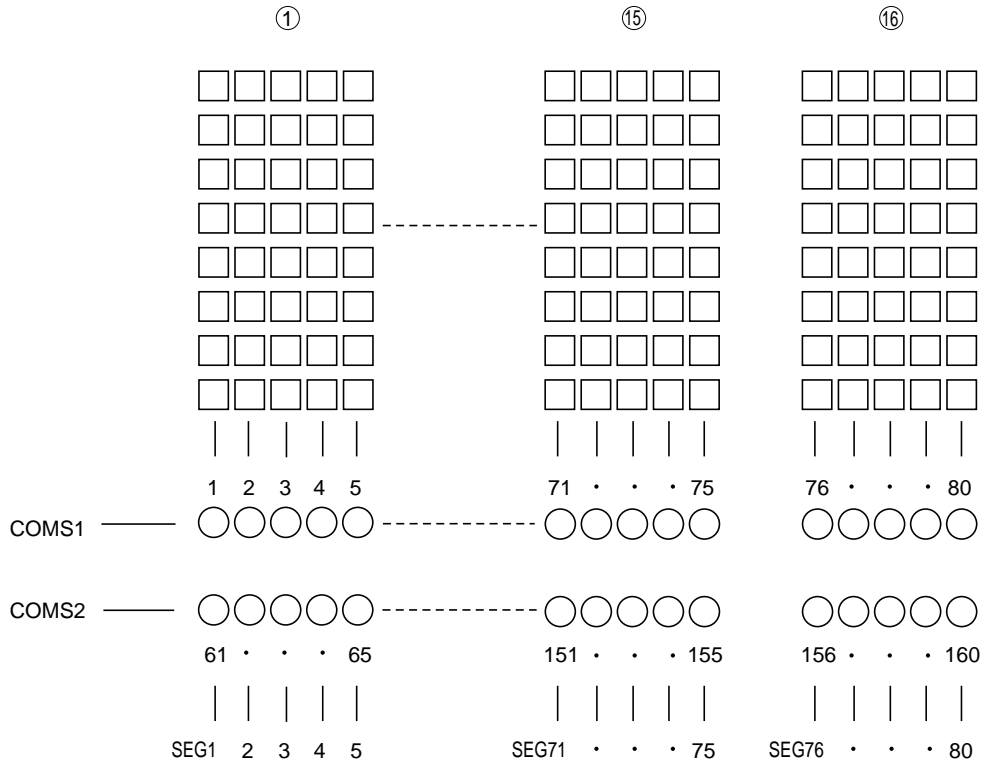

The SED1240 series is provided with a symbol register RAM that permits setting each symbol so that symbols may be displayed individually on the screen.

The symbol register capacity is 160 bits in both SED1240, SED1241 and SED1242 series and up to 160 symbols can be displayed.

Each symbol can be blink-controlled in units of bit by using D7 and D6.

The relation among symbol register display patterns, RAM address and write data is shown by citing an example.

[SED1240 (4-line 16-digit display), SED1241 (2-line 16-digit display)]

RAM address [RE = 1]		Bits for symbol							
		D7 ————— D0							
60H to 6FH	0	BONF	IORH	*	1	2	3	4	5
	1	BONF	IORH	*	6	7	8	9	10
	:	:							
	F	BONF	IORH	*	76	77	78	79	80
70H to 7FH	0	BONF	IORH	*	81	82	83	84	85
	1	BONF	IORH	*	86	87	88	89	90
	:	:							
	F	BONF	IORH	*	156	157	158	159	160

Note 1: When a symbol is 1.5 times as large as other bits, it is recommended to divide it into COMS1 and COMS2 for driving.

D7 (BONF)	D6 (IORH)	Function
0	*	No blink
1	0	D4 to D0 blink in black-and-white reverse form.
1	1	The bits of "1" out of D4 to D0 blink.

fBLINK : 1 to 2Hz

Static Icon RAM

The SED1240 series can display static icons in the standby mode.

Each of 10 icons can be set in respect of ON/OFF and

blink by using the pins of COMSA to SEGSA to J. The relation between static icon functions and static icon RAM write data is shown below.

RAM address [RE = 0]	SI data								Display				
	D7	D6	D5	D4	D3	D2	D1	D0	[<input type="checkbox"/> . . . OFF <input checked="" type="checkbox"/> . . . ON]				
00H	*	*	*	0	0	0	0	0	SEGSA B C D E				
	*	*	*	0	0	0	0	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	*	*	*	0	0	0	1	0	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

	*	*	*	1	1	1	1	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
01H	*	*	*	0	0	0	0	0	SEGSA B C D E				
	*	*	*	0	0	0	0	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
	*	*	*	0	0	0	1	0	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

	*	*	*	1	1	1	1	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

	*	*	*	0	0	0	0	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
	*	*	*	0	0	0	1	0	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

	*	*	*	1	1	1	1	1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

For static icons, blink ON/OFF control can be exerted independently for each pin.

RAM address [RE = 0]	ISB data VS pin								Function
	D7	D6	D5	D4	D3	D2	D1	D0	
02H	*	*	*	SEGSA	SEGSA	SEGSC	SEGSD	SEGSE	Blink 1 = ON 0 = OFF
03H	*	*	*	SEGSA	SEGSG	SEGSH	SEGSI	SEGSJ	

The following table shows a static icon ON/OFF function and static icon blink control.

RAM address [RE = 0]	SI data								Display				
	D7	D6	D5	D4	D3	D2	D1	D0	[<input type="checkbox"/> . . . OFF <input checked="" type="checkbox"/> . . . ON]				
00H	*	*	*	1	0	1	1	0	SEGSA B C D E				
02H	*	*	*	0	1	0	1	0	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
									<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

fBLINK: 1 to 2Hz

<Cautions for static icon operation>

- Be sure to write static icon data when the oscillating circuit is on. If the data is written when the oscillating circuit is off (Sleep Mode), previous display may remain and instantaneous lighting may occur.
- To perform resetting on the RES terminal except at the time of turning on power, turn off the static icon and blinking in advance, then turn off the oscillating circuit. If resetting is performed when the static icon or blinking is on, instantaneous lighting may be caused by stopping of the oscillating circuit.

Electronic Volume RAM

The SED1240 series is provided with an electronic volume function that permits controlling the liquid crystal drive voltage V_5 and adjusting the density of liquid crystal display. The electronic volume function can select one of 32 states of the liquid crystal drive voltage by writing 5-bit data into the electronic volume RAM.

When a V_5 voltage regulating built-in resistor is used, this function can attain a wider adjustment if the resistor ratio set command is used together.

The relation between electronic volume set RAM addresses and write data is shown below.

Function	RAMAddress [RE=0]	Electronic volume data								State	VEV
		D7	D6	D5	D4	D3	D2	D1	D0		
Electronic volume	08H	*	*	*	0	0	0	0	0	0	VREG-0

ABSOLUTE MAXIMUM RATINGS

Item	Symbol	Standard value	Unit
Supply voltage (1)	V _{SS}	-7.0 to +0.3	V
Supply voltage (2)	Double boosting Triple boosting	-7.0 to +0.3	V
		-6.0 to +0.3	
Supply voltage (2)	V ₅ , V _{OUT}	-18.0 to +0.3	V
Supply voltage (3)	V ₁ , V ₂ , V ₃ , V ₄	V ₅ to +0.3	V
Input voltage	V _{IN}	V _{SS} -0.3 to +0.3	V
Output voltage	V _O	V _{SS} -0.3 to +0.3	V
Operating temperature	T _{opr}	-30 to +85	°C
Storage temperature	TCP	T _{str}	°C
	Bare chip		
		-55 to +100	
		-65 to +125	

- Notes:
1. All the voltage values are based on V_{DD} = 0 V.
 2. The voltages of V₁, V₂, V₃, and V₄ must always meet the condition of V_{DD} ≥ V₁ ≥ V₂ ≥ V₃ ≥ V₄ ≥ V₅ and the condition of V_{DD} ≥ V₅ ≥ V_{OUT}, V_{DD} ≥ (V_{SS}, V_{SS2}) ≥ V_{OUT}.
 3. If the LSI is used exceeding the absolute maximum ratings, it may result in permanent destruction. It is desirable to use the LSI in the condition of electric characteristics at ordinary operation. If this condition is exceeded, a malfunction may be caused to the LSI, having a bad effect on its reliability.

- Operating voltage range for V_{SS} system (V_{SS} and V_{SS2}) and V₅ system (V₅)
Set the V_{SS2} to ensure that the V_{OUT} does not exceed the following operating voltage range:
It applies when an external power supply is used. When using an internal power supply, make sure to set V_{SS} in such that V_{OUT} may not exceed the operating voltage range of V₅ system given below.

DC CHARACTERISTICS

[V_{SS} = -5.5 V to -1.8 V, T_a = -30 to 85°C unless otherwise specified]

Dynamic system

Item		Symbol	Condition	min	typ	max	Unit	Applicable pin
Built-in power supply	Input voltage	V _{SS2}	Double boosting	-5.5	—	-1.8	V	V _{SS2}
			Triple boosting	-5.5	—	-1.8		
	Boosting output voltage	V _{OUT}	Double boosting	-11.0	—	—	V	V _{OUT}
			Triple boosting	-16.5	—	—		
	Voltage regulating circuit operating voltage	V _{OUT}	—	-16.5	—	-5.4	V	V _{OUT}
	Voltage follower operating voltage	V ₅	—	-16.0	—	-4.5	V	V ₅ *12
Reference voltage	V _{REG}	T _a = 25°C	-0.05%/°C	-2.06	-2.0	-1.94	V	—

- *1: The wide operating voltage range is guaranteed except the case where a sudden voltage change occurs during MPU access.
In the low-supply voltage data holding characteristic, it is applied in the sleep mode and MPU access cannot be guaranteed
- *2: At triple boosting, take care about supply voltage VSS2 so that it may not exceed the V5 operating voltage range.
- *3: D0 to D5, D6 (SCL), D7 (SI), A0, $\overline{\text{RES}}$, $\overline{\text{CS}}$, $\overline{\text{WR}}$ (E), P/S, IF, C86, $\overline{\text{CK}}$
- *4: This is a resistance value when a voltage of 0.1 V is applied between output pins SEGn, SEGSn, COMn, and COMSn, and each power pin (V1, V2, V3, V4). This is specified within the range of operating voltage (2).

$$\text{RON} = 0.1 \text{ V} / \Delta I$$

(ΔI : A current flowing when 0.1 V is applied between the power supply and the output)
- *5: Applies under the following conditions:
 - No access from MPU during all characters 'H' display
 - The built-in circuit and oscillating circuit are operating.
 - CGRAM unused, HPM = 0 specified, VSS = -3.0
- *6: Applies under the following conditions:
 - Standby mode
 - All the built-in power circuit off
 - Display off
 - Oscillating circuit on
- *7: Indicates that fcyc is used for writing at all times. The current consumption during access is approximately proportional to the access frequency (fcyc).
- *8: Specifies the $\overline{\text{RES}}$ signal minimum pulse width. To perform resetting, it is necessary to input the pulse having a width of trw or more. Original, the method for reset case 1 is used, but the method for reset case 2 can also be used if the reset start time condition of tRES or less is satisfied.

- *9: The boosting circuit performs boosting, using voltage between the VDD and VSS2 as source voltage. Check the VSS2 input voltage to ensure that it does not exceed VOUT absolute maximum rating, or the operating voltage range of the VSS system (VSS) and V5 system (V5).
- *10: Frequency fOSC of the internal circuit drive oscillating circuit and boosting clock fBST vary according to the type. The following shows the relationship between the oscillating circuit fOSC and boosting clock fBST:
 - $f_{\text{OSC}} = (\text{number of digits}) \times (1/\text{duty}) \times f_{\text{FR}}$
 - $f_{\text{BST}} = (1/2) \times (1/\text{number of digits}) \times f_{\text{OSC}}$
- *11: Enter the following input when performing operations by the external clock, without using the built-in oscillating circuit:
 - Duty = (th/tosc) \times 100 = 20 to 30%
 - $f_{\text{OSC}} = 1/\text{tosc}$

- *12: Adjust the V5 voltage regulating circuit within the voltage follower operating voltage range.

* All timing are specified on the basis of 20% and 80% of VSS.

AC CHARACTERISTICS

System Bus Write Characteristics I (80 series MPU)

[V_{SS} = -5.5 V to -4.5 V, T_a = -30 to 85°C unless otherwise specified]

Address setup time	A0	tSAS	—	50	—	ns
Address hold time		tSAH	—	500	—	ns
Data setup time	SI	tSDS	—	50	—	ns
Data hold time		tSDH	—	50	—	ns
CS-SCL time	CS	tCSS	—	150	—	ns
		tCSH	—	900	—	ns

*1: For the rise and fall time of input signals, set 15 ns or less.

*2: Every timing is specified on 20% and 80% of V_{SS}.

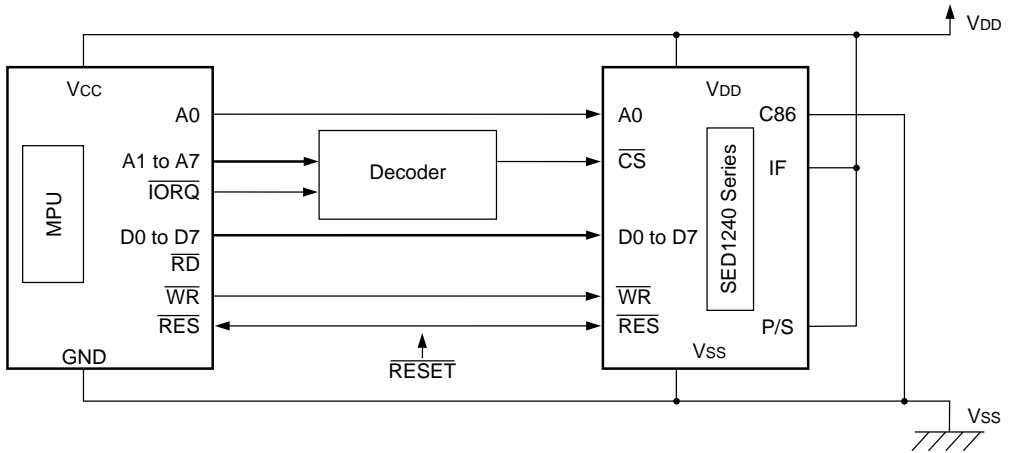

*3: To validate a command or data immediately before the rise of CS, tCSH must be satisfied at the latch timing of D0 data. If CS is started at another data latch timing, the previous command or data will not be input.

MPU INTERFACE CONNECTION EXAMPLES (FOR REFERENCE)

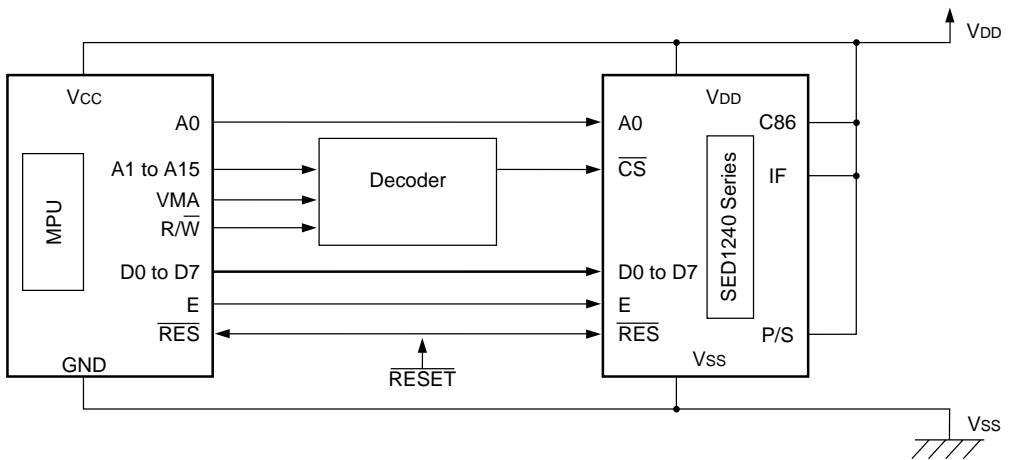

The SED1240 series can be connected to the 80 series MPU or 68 series MPU. Furthermore, it can be operated with less signal lines if the serial interface is used.

When an MPU bus, port, etc. are put into high-impedance for a certain period by RESET, input RESET into this machine after the input to the SED1240 series becomes definitive.

LIQUID CRYSTAL DRIVE WAVEFORM (B WAVEFORM)

Example of Setting the Instructions (Reference)

(1) Initialization

This IC has no power-on reset function when power is turned on. Accordingly, the IC internal status is

indefinite when the power has been turned on. Be sure to initialize the system. If electric charge remains in the smoothing capacitor connected between the liquid crystal drive voltage output terminal (V1 to V5) and VDD terminal, such a trouble as temporary blackening will occur when power is turned on. To avoid such a trouble, follow the steps given below:

Note 0 : (0) is a NOP command. This command has a function to clear the test mode. After resetting, it is recommended to execute this command several times before starting input. It is also recommended to execute it on a periodic basis at a proper position of the insutraction.

Note 1: (7) denotes RAM initialization. Set the contents to be displayed in the beginning. For items not to be displayed (RAM clear), use the following steps:
 - DDRAM - write 20H (character code).
 - CGRAM - write 00H (data "0").
 - Symbol register - write 00H (data "0").

The RAM data is unspecified at the time of \overline{RES} input (after power is turned on). If the data "0" is not written at this stage, unexpected display may occur to the unset position.

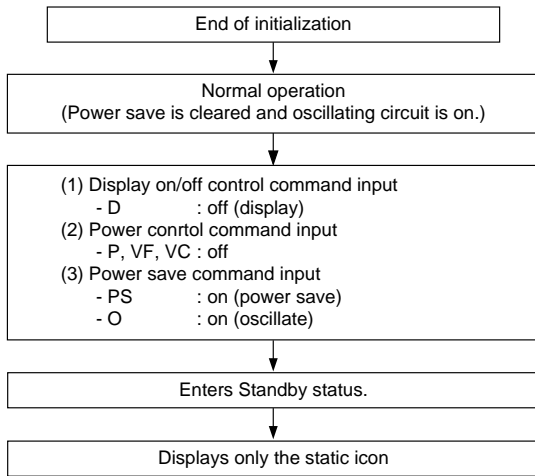

Note 2: Defined by the rising characteristics of the boosting circuit, power regulating circuit and voltage and follower circuit, time setting varies according to the external capacity. So be sure to make confirmation by external capacity, and set this time.

Note 3: The dynamic drive system display lamp is lit up by the display on/off command when it is on. The static icon lamp is lit by the static icon control command. So to light up the lamp simultaneously with start of display, execute the display on/off control command and static icon control within one frame.

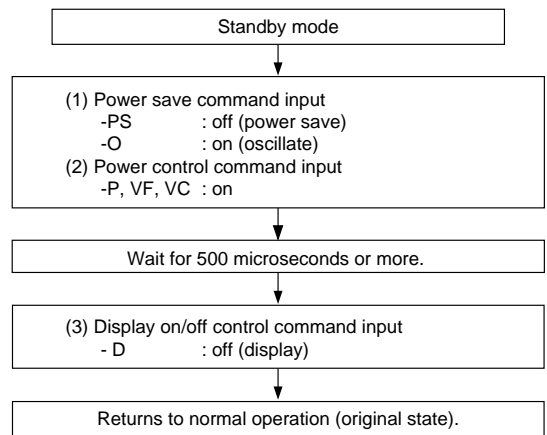

Note 4: Static icon control must be operated when the oscillating circuit is on. (This is mandatory.)

Note 5: (0) to (8) must be performed when display is off.

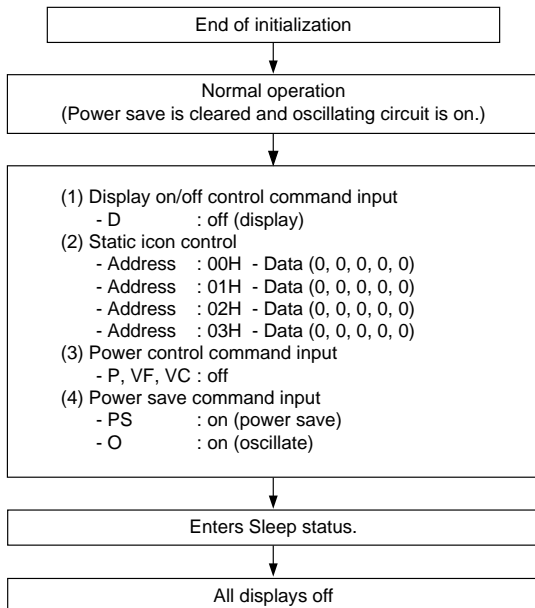

(2-1) Setting the Standby mode

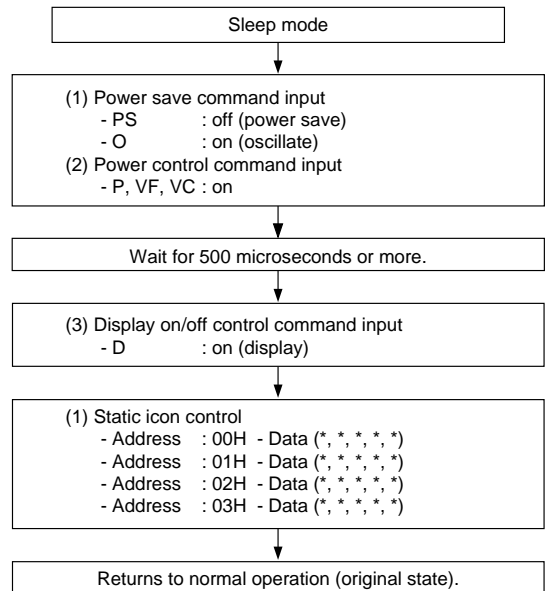

(2-1) Resetting the Standby mode

(3-1) Setting the Sleep mode

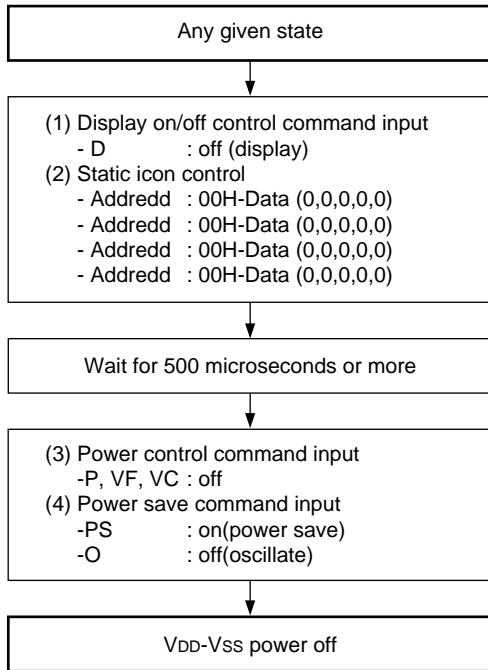

(3-1) Resetting the Sleep mode

(4) Power off sequence

Similar to the case of power on sequence, if this IC power is turned off when the built-in power is on, power supply to the built-in liquid crystal drive circuit may continue for a very little time, adversely affecting the liquid crystal panel display quality. To prevent this, strictly follow the power off sequence.

OPTIONS LIST

The SED 1240 series has the following options. Options are available exclusively for users. Please contact our Sales Department.

- The following shows how to define the name of the product compatible with options:

(Example) SED124XXX

Character Generator ROM (CGROM) Specifications

The SED1240 series is provided with a character generator ROM for up to 544 types of characters. Each character size is of a structure of 5 × 7 (8) dots.

This CGROM is designed as a masked ROM, and is compatible with the CGROM for exclusive use of the user. For the standard CGROM, see the Character Font Table.

TCP Specifications

The SED1240 series is compatible with the TCP specifications exclusive to the user, in addition to our standard TCP. Please contact our Sales Department for information.

Example of TCP Arrangement

Note: The following does not specify the TCP external view.

REFERENCE

SED1240TXX: COM1 to 16, (COM17 to 24) and [COM25 to 32] are used.
 SED1241TXX: COM1 to 16 and (COM17 to 24) are used. [COM25 to 32] is for NC.
 SED1242TXX: COM1 to 16 is used. (COM17 to 24) and [COM25 to 32] are for NC.

OVERVIEW

The SED1278 is a dedicated character display controller/driver which, when used with the SED1181F or the SED1681 segment drivers, is able to display up to 80 characters under 4- or 8-bit MPU control.

The internal character generator (CG) ROM has an extended 240, 5×10 pixel, character set, plus CGRAM space for an additional eight user definable 5×8 pixel characters. These memory features combined with the rich set of control instructions offer the potential for a highly flexible character display system.

The SED1278 features a guaranteed minimum LCD drive voltage of 3 V making it suitable for use with low voltage LCD panels.

FEATURES

- Interface for 4- and 8-bit MPUs
- Display RAM – 80 bytes (80 characters)
- Character generator ROM – 240 characters
 - 5×8 pixel font
- Character generator RAM – 64 bytes
 - 5×8 pixel font, 8 characters.
 - 5×10 pixel font, 4 characters.
- Number of characters used

	Duty	SED1278F	SED1181FLA	No. of characters used
One-line display	1/8, 1/11	1	0	8 columns × 1 line
			6	80 columns × 1 line
Two-line display	1/16	1	0	8 columns × 2 lines
			3	40 columns × 2 lines

- Powerful display control instructions
- LCD driver outputs
 - 40 segment driver outputs
 - 16 common driver outputs
- Low LCD drive voltage – 3 V minimum (V_{DD}–V₅)
- Dual-frame AC drive
- On-chip power-on reset
- On-chip RC oscillator
- Single 5 V operation
- Chip (SED1278D) and 80-pin QFP (SED1278F) packages

(Compatible with HD 44780 and HD 66780 by Hitachi Limited)

The SED1278 is equivalent to the HD 44780 and HD 66780 by Hitachi Limited. Before use, make sure that there is no problem for practical use. It should be noted that this is not intended to guarantee enforcement of industrial property and other rights, or to grant license for the use of this product.

SED1278

PIN DESCRIPTION

MPU Interface

- RS** Register select signal input. Selects between the data and instruction registers during CPU access.
RS = 0: Instruction register access cycle
RS = 1: Data register access cycle
- R/W** This input selects between SED1278 register read and write cycles.
R/W = 0: Register write cycle
R/W = 1: Register read cycle
- E** Read/write execute signal input.

DB0 to DB7 TTL level data input/output lines, for connection to the system MPU data bus.

TABLE 1 The Function of the E Signal

RS	R/W	E	Operation
0	0		Instruction write cycle
0	1	1	Busy flag read cycle Address counter read cycle
1	0		DDRAM or CGRAM data write cycle
1	1	1	DDRAM or CGRAM data read cycle

LCD Panel Interface

- COM1 to COM16** Common driver outputs to the LCD panel.
- SEG1 to SEG40** Segment driver outputs to the LCD panel.
- OSC1** If the internal RC oscillator is used to generate the LCD drive signals, the feedback resistor, R_f, is connected to this pin. If an external clock source is used, the clock is connected to this pin.
- OSC2** If the internal RC oscillator is used to generate the LCD drive signals, the feedback resistor, R_f, is connected to this pin. If an external clock source is used, this pin is left open.

External Segment Driver Interface

- LP** Data latch pulse output for an external X-driver.
- XSCL** Data shift clock output for an external X-driver.
- FR** LCD AC-drive waveform for an external X-driver.
- DO** Display data output for an external X-driver.

TERMINAL CONFIGURATION

1. Input terminal configuration (1)

2. Input terminal configuration (2) With pull-up MOS resistor

3. Output terminal configuration

SED1278

4. Input/Output terminal configuration

INSTRUCTION DESCRIPTION

Instruction Summary

Instruction	Code										Description	Cycle Time (max.)
	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Clear Display	0	0	0	0	0	0	0	0	0	1	Clears all display data and sets DDRAM address 0 in the address counter.	410 clocks
Return Home	0	0	0	0	0	0	0	0	1	*	Set DDRAM address 0 in the address counter. Also returns any shifted data to home. The contents of DDRAM remain unchanged.	410 clocks
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	S	Specifies the direction in which the cursor moves and whether the display is to be shifted or not, when data is written to or read from memory	10 clocks
Display ON/OFF	0	0	0	0	0	0	1	D	C	B	Sets all display on/off (D) cursor on/off (C), and character blinking in the cursor position (B).	10 clocks
Cursor or Display Shift	0	0	0	0	0	1	S/C	R/L	*	*	Moves the cursor and shifts the display without changing the contents of DDRAM.	10 clocks
System Set	0	0	0	0	1	IF	N	F	*	*	Sets the interface data length (IF), number of characters to be displayed (N), and character font (F).	10 clocks
Set CGRAM Address	0	0	0	1	ACG					Set CGRAM addresses, followed by transfer of CGRAM data.	10 clocks	
Set DDRAM Address	0	0	1	ADD					Sets DDRAM address, followed by transfer of DDRAM data.	10 clocks		
Read Busy Flag and Address	0	1	BF	ACC					Reads the busy flag (BF) which indicates internal operation and the contents of the address counter.	0		
Write Data to CG or DDRAM	1	0	Write Data					Writes data to DDRAM or CGRAM.	10 clocks			
Read Data from CG or DDRAM	1	1	Read Data					Reads data from DDRAM or CGRAM.	10 clocks			

* Don't care

Write Only Instructions

Clear Display

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	0	0	0	1	01H

RS = 0

This instruction

1. loads all locations in the display data (DD) RAM with 20H.
2. clears the contents of the address counter to 0H.
3. sets the display for zero character shift.
4. sets the address counter to point to the DDRAM.
5. , if the cursor is displayed, moves the cursor to the left most character in the display or, if a two line display is used, moves the cursor to the leftmost character in the top line (line 1).
6. sets the address counter to increment on each access of DDRAM or CGRAM.

Cursor Home

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	0	0	1	*	02H, 03H

RS = 0

This instruction

1. clears the contents of the address counter to 0H.
2. sets the address counter to point to the DDRAM.
3. sets the display for zero character shift.
4. , if the cursor is displayed, moves the cursor to the left most character in the display or, if a two line display is used, the left most character in the top line (line 1).

Entry Mode Set

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	0	1	I/D	S	04H to 07H

RS = 0

- The I/D bit selects the way in which the contents of the address counter are modified after every access to DDRAM or CGRAM.
 - I/D = 1: The address counter is incremented.
 - I/D = 0: The address counter is decremented.
- The S bit enables display shift, instead of cursor shift, after each write or read to the DDRAM.
 - S = 1: Display shift enabled.
 - S = 0: Cursor shift enabled.

The direction in which the display is shifted is opposite in sense to that of the cursor. For example if S = 0 and I/D = 1 the cursor would shift one character to the right after an MPU write to DDRAM. However if S = 1 and I/D = 1, the display would shift one character to the left and the cursor would maintain its position on the panel.

The cursor will already be shifted in the direction selected by I/D during reads of the DDRAM, irrespective of the value of S. Similarly reading and

writing the CGRAM always shifts the cursor. Note that if a two line display is used both lines will be shifted simultaneously.

Display ON/OFF

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	1	D	C	B	08H to 0FH

RS = 0

This instruction controls various features of the display.

- The D bit turns the entire display on or off.
 - D = 1: Display on
 - D = 0: Display off
 - The C bit turns the cursor on or off.
 - C = 1: Cursor on
 - C = 0: Cursor off
 - The B bit enables blinking of the character the cursor coincides with.
 - B = 1: Blinking on
 - B = 0: Blinking off
- Blinking is achieved by alternating between a normal and all dark display of a character. The blinking period is set at 204800 fosc. For example if fosc = 250 kHz the cursor will blink with a period of 0.8192 seconds, or about 1.2 Hz.

Cursor/Display Shift

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	1	S/C	R/L	*	*	10H to 1FH

RS = 0

This instruction shifts the display and/or moves the cursor, on character to the left or right, regardless of a DDRAM ready/write.

- The S/C bit selects movement of the cursor or movement of both the cursor and the display.
 - S/C = 1: Shift both cursor and display
 - S/C = 0: Shift cursor only
- The R/L bit selects leftward or rightward movement of the display and/or cursor.
 - R/L = 1: Shift one character right
 - R/L = 0: Shift one character left

System Set

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	1	IF	N	F	*	*	20H to 3FH

RS = 0

This instruction initializes the system, and must be the first instruction executed after power-on.

- The IF bit selects between an 8-bit or a 4-bit MPU interface.
 - IF = 1: 8-bit MPU interface using DB7 to DB0.
 - IF = 0: 4-bit MPU interface using DB7 to DB4.
- The N and F bits select the number of display lines and the corresponding duty cycle, as listed in table 2.

TABLE 2 Combinations of Display Lines and Duty Cycle

N	F	Number of Line	Duty Ratio	Common Output Signal	Non-Selected Common Output Signal
0	0	1 line	1/8	COM1 to COM8	COM9 to COM16
0	1	1 line	1/11	COM1 to COM11	COM12 to COM16
1	*	2 lines	1/16	COM1 to COM16	—

Set CGRAM Address

DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

0	1	ACR	40H to 7FH
---	---	-----	------------

RS = 0

This instruction

1. loads a new 6-bit address into the address counter.
2. sets the address counter to address CGRAM.

Once “Set CGRAM Address” has been executed, the contents of the address counter will be automatically modified after every access of CGRAM, as determined by the “Entry Mode Set” instruction.

If the “Set CGRAM Address” instruction is issued by the system MPU while the display is enabled, and if either the cursor is on or blink is on, pseudo-cursor or pseudo-blink appears. To prevent this, turn both the cursor and display blink off before loading a new CGRAM address. The active width of the address counter, when it is addressing CGRAM, is 6-bits so the counter will wrap around to 00H from 3FH if more than 64 bytes of data are written to CGRAM.

Set DDRAM Address

DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

1	ADD
---	-----

RS = 0

- 80H to CFH ... 1 line
- 80H to A7H line 1 ... 2 line
- C0H to E7H line 2 ... 2 line

This instruction

1. loads a new 7-bit address into the address counter.
2. sets the address counter to point to the DDRAM.

Once the “Set DDRAM Address” instruction has been executed, the contents of the address counter will be automatically modified after each access of DDRAM, as selected by the “Entry Mode Set” instruction.

The SED1278 has only 80 DDRAM locations. The valid address spaces for various display configurations are listed in table 3.

TABLE 3 Valid CGRAM Address Ranges

Number of Lines	Characters	ADR
1-line	80	00H to 4FH
2-line	1st line	00H to 27H
	2nd line	40H to 67H

Write Data

DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

DATA

RS = 1

This instruction writes the data in DB7 to DB0 into either the CGRAM or the DDRAM. The RAM space (CG or DD), and the address in that space, that is accessed depends on whether a “Set CGRAM Address” or a “Set DDRAM Address” instruction was last executed, and on the parameters of that instruction.

The contents of the address counter will be automatically modified after each “Write Data”, as determined by “Entry Mode Set”. When data is written to the CGRAM, the DB7, DB6 and DB5 bits are not displayed directly as characters.

Read Only Instructions

Read Busy Flag/Address Counter

DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

BF	Acc
----	-----

RS = 1

Reading the instruction register yields the current value of the address counter and the busy flag. This instruction must be executed prior to any other instructions.

- ACC, the address counter value, will point to a location in either CGRAM or DDRAM, depending on the type of “Set RAM Address” instruction last sent. In “Busy Flag Check” immediately after executing “RAM Address Set” instruction, a valid address counter value can be read 5 clock cycles after the busy flag (BF) goes low. In “Busy Flag Check” immediately after executing “Write Data” instruction, a valid address counter value can be ready as soon as BF goes low.
- The BF bit shows the status of the busy flag.
 - BF = 1: SED1278 busy.
 - BF = 0: SED1278 ready for next instruction.

Read Data

DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

DATA

RS = 1

This instruction reads data from either CGRAM or DDRAM, depending on the type of “Set RAM Address” instructions last sent. The address in that space depends on the “Set RAM Address” instructions parameters. Immediately before executing “Read Data”, “Set CGRAM Address” or “Set DDRAM Address” must be executed.

The contents of the address counter are modified after each “Read Data”, as determined by “Entry Mode Set”. Display shift is not executed, independently of “Entry Mode Set”.

OPERATION

The Busy Flag

The SED1278 takes between 10 and 410 clock cycles to execute instructions. During that period additional instructions should not be issued. The device is provided with a busy flag to let the user check the internal state of the chip. BF should be 0 before another instruction is issued.

If the busy flag is not checked between instructions the user must arrange for a guaranteed delay of more than the instruction execution time, before issuing the next instruction.

4-Bit MPU Interface

If a “System Set” instruction is issued with bit 4 set to 0, then the SED1278 will operate with a 4-bit MPU data bus interface.

If a 4-bit interface is used, the 8-bit instructions are written nibble by nibble; the high-order nibble being written first, followed by the low-order nibble. It is not necessary to check the busy flag between writing separate nibbles of individual instructions.

Reading the Busy Flag/Address Counter yields the high-order nibble first, followed by the low-order nibble.

System Initialization

Power-on reset

Although the SED1278 has no external reset input, it will automatically reset on system power-on. The sequence starts once $V_{DD} < 4.5\text{ V}$.

While the SED1278 is resetting the busy flag is set to 1. The reset takes about 3,750 clock cycles. For example if $f_{OSC} = 250\text{ kHz}$, the reset sequence takes about 30 ms.

Reset places the SED1278 in a state where

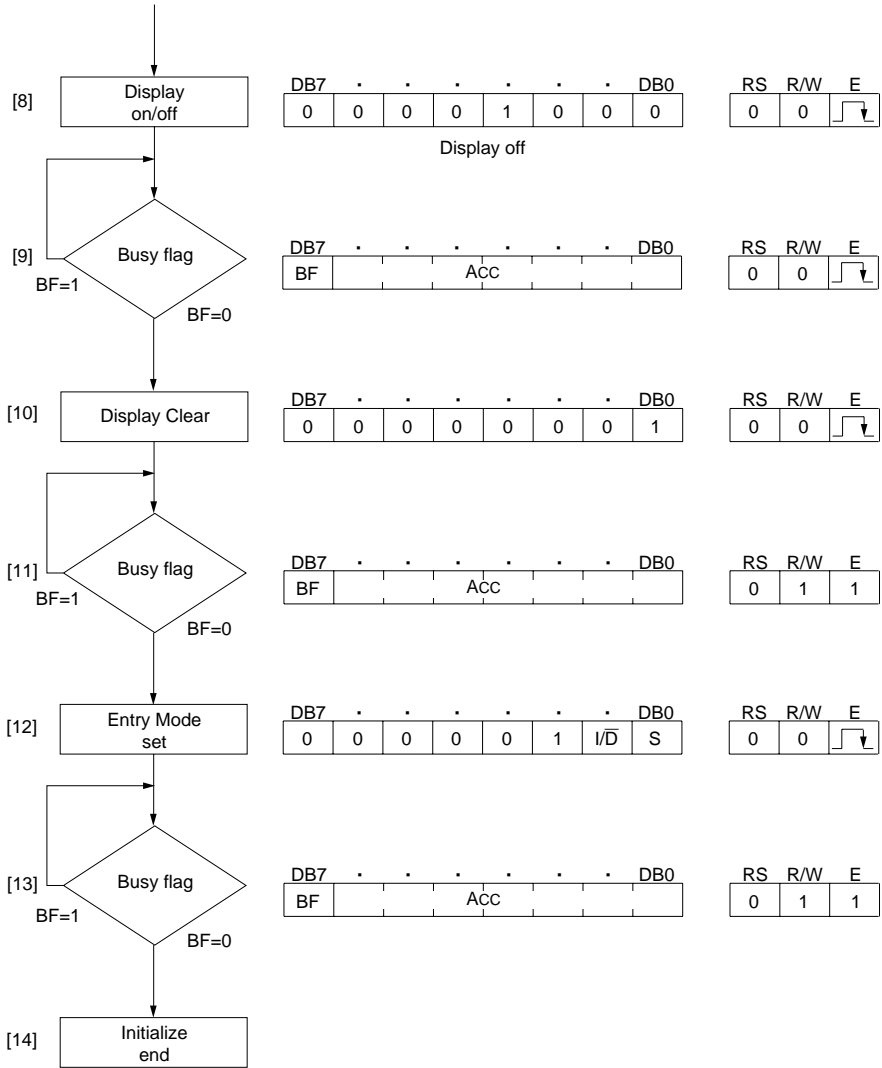

- the display is clear.
- the system configuration corresponds to
 - IF = 1: 8-bit MPU interface
 - N = 0: 1-line display
 - F = 0: 1/8 duty cycle
- the display configuration corresponds to
 - D = 0: Display off
 - C = 0: Cursor off
 - B = 0: Blink off
- the entry mode is set to
 - I/D = 1: Increment
 - S = 1: No display shift

Software initialization

Initialization during power-on reset involves several unstable factors related to power-supply output fluctuations. For this reason it is strongly recommended that a software initialization sequence is followed.

- Software Initialization (8-bit MPU bus, fOSC = 250 kHz)

• Software Initialization (4-bit MPU bus, fosc = 250 kHz)

THE CHARACTER GENERATOR

Character Generator ROM (CGROM)

The SED1278 contains a 240 character, masked CGROM. Each character is 5×10 pixels, for 1/11 duty cycle compatibility. Refer to Appendix A for available codes and their corresponding fonts.

Because the CGROM is masked, customers may arrange to have their own CGROM masks made.

A custom mask allows the user to have

- their own character set.
- a character set of up to 256 characters.

Please contact the SEIKO EPSON Marketing Department for further information.

If a custom CGROM is used, two things should be noted.

1. The “Clear Display” instruction relies on the character whose code is 20H being a blank.
2. If more than 240 ROMed characters are specified, then the number of CGRAM characters available is correspondingly reduced. The physical RAM space is still available, and is available for use as memory, however it will no longer have an associated character code.
3. The character ROM implemented in a particular chip is indicated by a two character suffix attached to the device number, for example SED1278F0A.

Character Generator RAM (CGRAM)

The SED1278 has 64 bytes of CGRAM, allowing the user to program up to 8 characters.

5×8 pixel font (1/8 or 1/16 duty cycle)

The maximum character height is 8 pixels, however if a cursor is used row 7 should be all zeros. 8 such characters are available to the user.

The CGRAM address is made up of the following components.

- The least significant three bits, a2 to a0, specify the row number of the character data.
- Bits a5 to a3 are made up of the least significant three bits of the character code.
- The most significant bit, a7, is ignored.

Figure 1 shows an example 5×8 pixel font.

CGRAM address						CGRAM data (Character pattern)							
A5	A0	DB7	DB0
0	0	0	0	0	0	*	*	*	0	0	0	0	1
0	0	0	0	0	1	*	*	*	0	0	0	0	1
0	0	0	0	1	0	*	*	*	0	1	0	0	1
0	0	0	0	1	1	*	*	*	1	1	1	1	1
0	0	0	1	0	0	*	*	*	0	1	0	0	0
0	0	0	1	0	1	*	*	*	0	0	0	0	0
0	0	0	1	1	0	*	*	*	0	0	0	0	0
0	0	0	1	1	1	*	*	*	0	0	0	0	0

Figure 1 A 5×8 Pixel Font

5×11 pixel font (1/11 duty cycle)

The maximum character height is 11 pixels, however if a cursor is used row 10 must be left blank.

The SED1278 requires that, although the maximum character height is 11 rows, each character is allocated 16 rows (bytes) of address space. The last five bytes are ignored.

The CGRAM address is made up of the following components.

- The least significant 4 bits, a3 to a0, specify the row number of the character data.
 - Bits a5 and a4 correspond to bits 2 and 3, respectively, of the character code.
 - The most significant bit, a7, is ignored.
- Figure 2 shows an example 5×11 pixel font.

CGRAM address						CGRAM data							
A5	A0	DB7	DB0

LCD INTERFACE

LCD Drive Voltages

The SED1278 generates segment and common drive signals using the voltages supplied to pins V1, V2, V3, V4 and V5. The voltage levels at these pins depend on the duty cycle of the display. The specifications of these voltages.

The simplest way of producing these voltages is to use a resistive dividing network.

Figures 3 and 4 show examples of networks for 1/8, or 1/11, and 1/16 duty cycles respectively.

Figure 3 LCD Drive Voltage Network – 1/8 or 1/11 Duty Cycle

Figure 4 LCD Drive Voltage Network – 1/16 Duty Cycle

- Notes:
1. V5 is set using a potentiometer and $(V_{DD}-V_{SS})$.
 2. The power supply to the SED1278 should be bypassed with a capacitor, C_0 , of at least $0.1 \mu\text{F}$ placed as close to the chip as possible.

LCD Drive Signal Waveforms

The segment and common drive waveforms generated by the SED1278, for various duty cycle ratios, are shown in figures 5, 6 and 7.

Figure 5 1/8 Duty Cycle Drive Waveforms

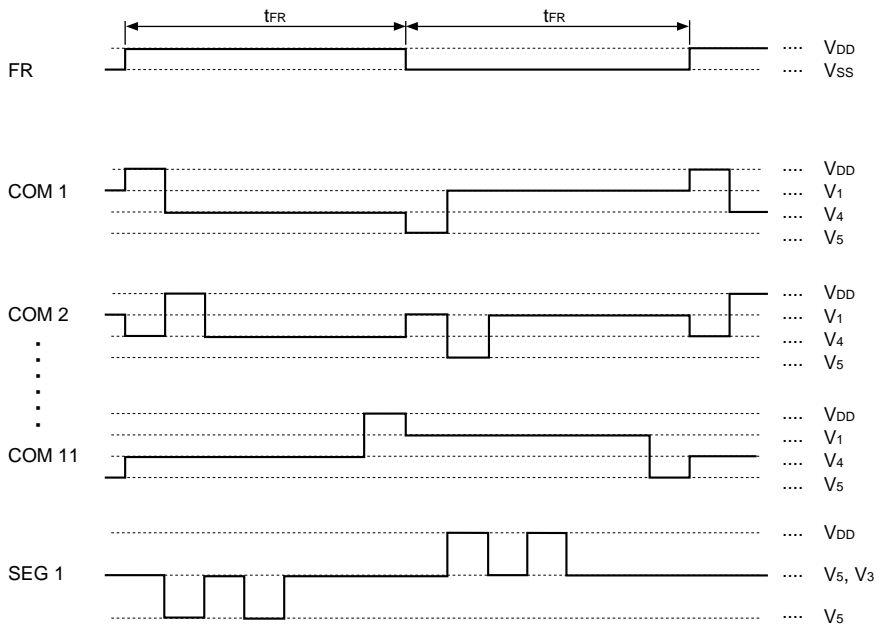

Figure 6 1/11 Duty Cycle Drive Waveforms

Figure 7 1/16 Duty Cycle Drive Waveforms

LCD Interface Configurations

The SED1278 has 16 common and 40 segment drive outputs, enabling the chip to drive up to 16 characters by itself. The drive capability can be expanded to 80 characters, by using SED1181FLA external segment drivers.

OVERVIEW

The SED1280 is an enhanced version of the SED1278 dot-matrix LCD controller. In addition to the SED1278 functionality, the SED1280 also incorporates a key-matrix controller, LED drivers and additional input and output ports.

The SED1280 comprises the SED1278 core, display data and character generator RAM, character generator ROM, LCD segment and common drivers, LED-matrix and key-matrix inputs and outputs, extended input and output ports and a serial microcontroller interface. The SED1280 operates from a 5 V supply and is available in 100-pin QFP5s.

FEATURES

- LCD controller
 - 80-byte, 80-character display data RAM
 - Character generator ROM
 - 240, 5 × 10-pixel characters
 - Character generator RAM
 - 64 bytes
 - Eight selectable 5 × 7-pixel or 5 × 8-pixel characters.
 - Four selectable 5 × 10-pixel or 5 × 11-pixel characters
- Outputs
 - 40 segment outputs
 - 16 common outputs
- Modes

Display type	Duty	Number of SED1181F common drivers	Character configuration (columns × rows)
One line	1/8 or	0	8 × 1
	1/11	6	80 × 1
Two lines	1/16	0	8 × 2
		3	40 × 4

- Key matrix scan controller
 - Eight key-scan outputs
 - Ten key-scan inputs
 - Can control an 8 × 10 key matrix.
- LED controller
 - Five LED driver outputs
 - Eight LED driver commons
 - Can control a 5 × 8-LED matrix
- I/O ports
 - Three input ports
 - Two output ports
- Serial microcontroller interface
- Single 5 V supply
- 100-pin QFP5

BLOCK DIAGRAM

PIN DESCRIPTION

Number	Name	Description
1	Vss	Ground
2 to 6	V1 to V5	LCD controller power supply inputs

V _{DD} , V _{SS} and V ₁ to V ₅ breakdown voltage	V _S	C = 200 pF, R = 0 Ω	–250	–	250	V

Measurement conditions

The measurement circuit is shown in the following figure. The switch is in position A until capacitor C charges to V_C volts. It then switches to position B and the capacitor discharges through the device under test (DUT), applying a surge voltage to the test pin. All other pins are left open.

The supply voltages, V_C , increases in 50 V steps from 50 V to a maximum of 1 kV, or until the device breaks down. Breakdown has occurred if the leakage current between the test pin and the GND pin increases by $0.1 \mu\text{A}$ when the absolute maximum rated voltage is applied to the test pin.

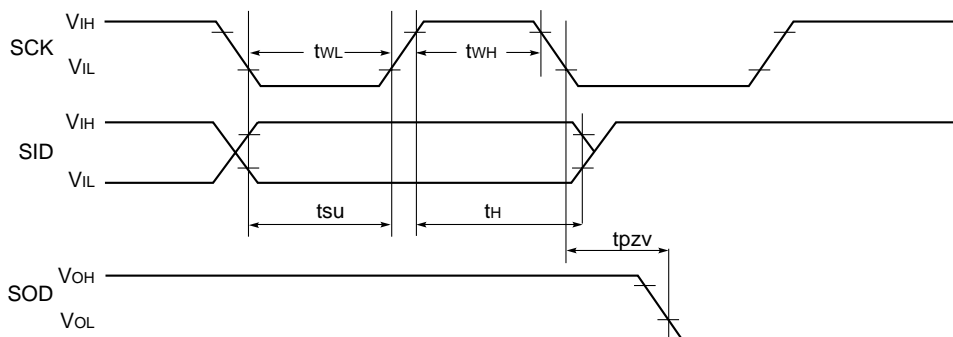

AC Electrical Characteristics

Serial data timing

$V_{DD} = 5 \text{ V}$, $V_{SS} = 0 \text{ V}$, $T_a = -20 \text{ to } 75^\circ\text{C}$

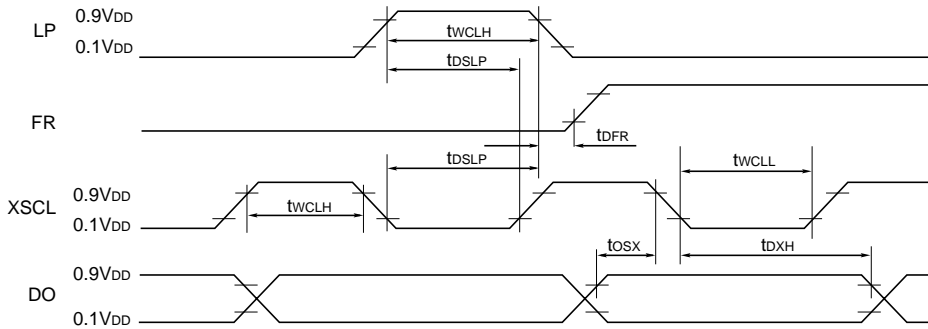

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
SCK LOW-level pulsewidth	t_{WL}		0.35	–	0.65	μs
SCK HIGH-level pulsewidth	t_{WH}		0.35	–	0.65	μs
Data setup time	t_{SU}		200	–	–	ns
Data hold time	t_H		200	–	–	ns
Output delay time	t_{PZY}		–	–	200	ns

Expanded segment output timing

$V_{DD} = 5.0 \text{ V}$, $V_{SS} = 0 \text{ V}$, $T_a = -20 \text{ to } 75^\circ\text{C}$

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
LP and XSCL LOW-level pulsewidth	t_{WCLL}		$0.8 \times 2/f_c$	–	–	ns
LP and XSCL HIGH-level pulsewidth	t_{WCLH}		$0.8 \times 2/f_c$	–	–	ns
XSCL to LP and LP to XSCL setup time	$t_{DSL P}$		$0.7 \times 2/f_c$	–	–	ns
DO to XSCL setup time	t_{OSX}		$0.7 \times 2/f_c$	–	–	ns
XSCL to DO hold time	t_{DHX}		$0.7 \times 2/f_c$	–	–	ns
FR delay time	t_{DFR}		–1	–	1	μs

Reset timing

$V_{DD} = 5.0\text{ V}$, $V_{SS} = 0\text{ V}$, $T_a = -20\text{ to }75^\circ\text{C}$

Note: $0.1\text{ ms} \leq t_r \leq 10\text{ ms}$, $t_r \geq 1\text{ ms}$, $t_{rST} \geq 30\text{ ms}$.

FUNCTIONAL DESCRIPTION

Serial Data Communication

The SED1280 uses a synchronous serial data system, with all timing referenced to SCK. Data communication uses a 4-bit synchronization pattern.

Serial data reception

Data input on SID is clocked into the receiver buffer on the falling edge of SCK as shown in the following figure.

As the buffer state is undefined after power-ON, \overline{RST} should be momentarily held LOW after power-ON to set all bits of the buffer to 1. Data loaded into the buffer is compared with the

synchronization pattern. If a match is detected, the next bit is treated as the start of the data block. The synchronization pattern should be repeated between consecutive blocks as shown in the following figure.

Data reception limits

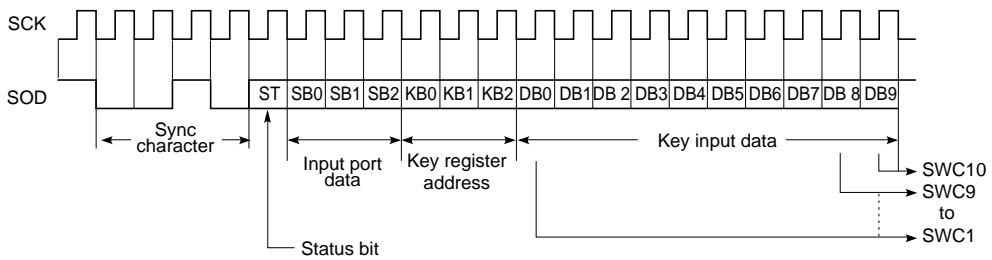

The receiver incorporates two data buffers—buffer 1 and buffer 2. When continuously receiving data, buffer 1 fills first, then buffer 2. New data blocks are only received when both buffers are empty. New data is lost if it is sent while the controller is processing data in one or both

buffers. The busy status bit, ST1, is set to 1 while the controller is processing data. Note that new data cannot be received while data is being transmitted, and that two data blocks received consecutively are treated as a single block.

Serial data transmission

SWC1 to SWC10 and EI1 to EI3 are scanned and their input logic levels transmitted serially from SOD as

shown in the following figure. Data is clocked out on the falling edge of SCK.

As the state of SOD is undefined after power-ON, \overline{RST} should be momentarily held LOW after pow-ON to set SOD HIGH. SOD remains HIGH until the first command from the host is received and returns HIGH when data transmission is complete.

Data transmission and reception timing

Data transmission starts from the first falling edge of SCK after a block of data has been received. If two blocks of data are received consecutively, data transmission starts from the first falling edge of SCK after the first block has been received, as shown in the following figure.

Status bit

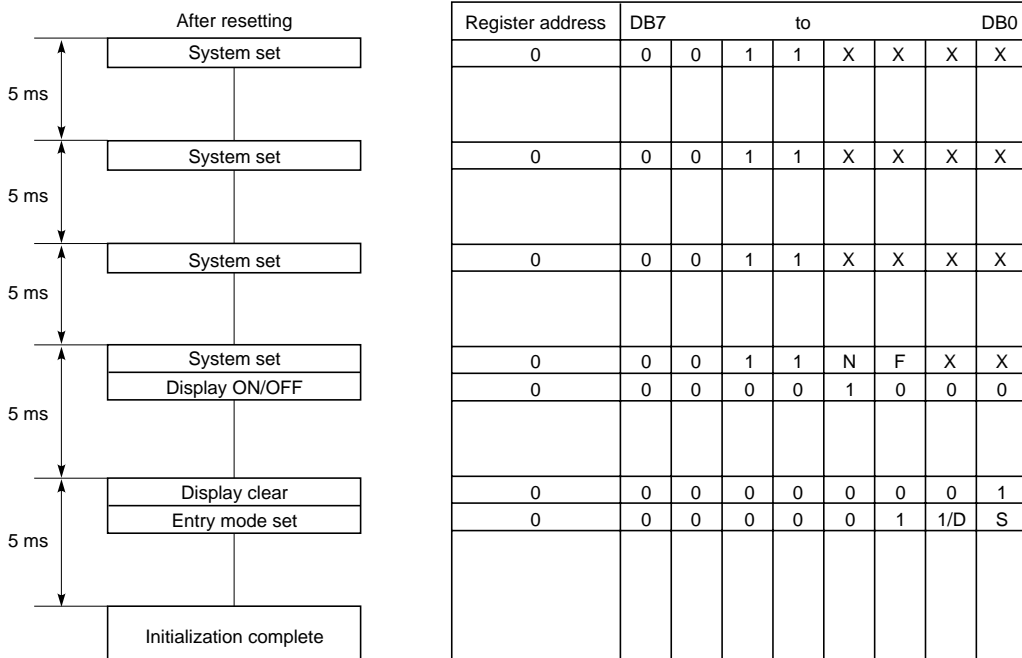

The ST1 status bit indicates that the controller is processing received data and cannot receive new data. When ST1 is HIGH, data is being processed and the host should not transmit new data until ST1 is LOW.

The host should begin checking ST1, as shown in the following figure, as soon as it transmits new data.

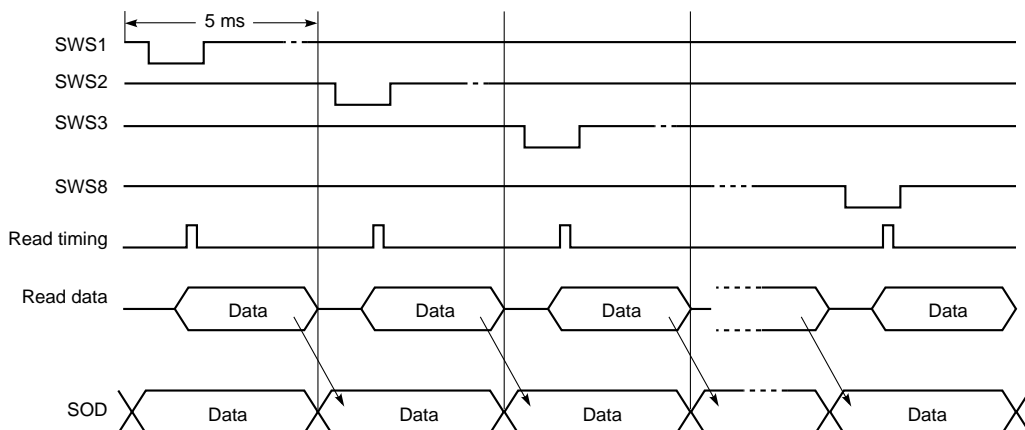

Register address	DB7 to DB0							
	DB7							DB0
0	0	0	1	1	X	X	X	X
0	0	0	1	1	X	X	X	X
0	0	0	1	1	X	X	X	X
0	0	0	1	1	N	F	X	X
0	0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	1	1/D	S
2	X	X	X	X	X	X	X	X

If the host does not check ST1, it should determine when to send new data by calculating the processing time of each data block as shown in the following figure.

Key switch and input data

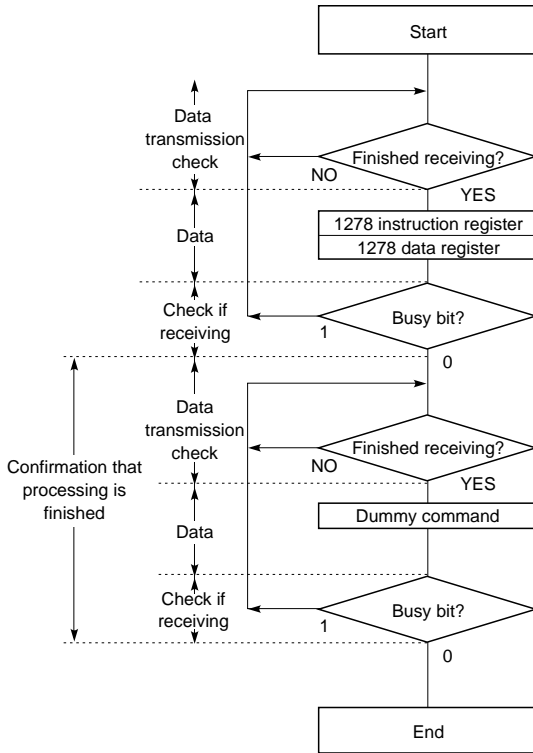

The SED1280 scans the key inputs and expanded input ports once every 5 ms. The scanned data is then output on SOD as shown in the following figure. The status bit is updated each time data is transmitted.

Data transmission flow charts

The following figures show the 1278 core display data RAM processing when data is transferred from the host to the SED1280.

Transmission using the busy bit

Register address	DB7	to						DB0
0	1	Address data						
1	DDRAM write data							
2	X	X	X	X	X	X	X	X

Timed access transmission

Register address	DB7	to						DB0
0	1	Address data						
1	DDRAM write data							

System Registers

The system registers access the data display RAM, character generator RAM and LED display RAM. These write-only registers are addressed using RA0 to RA2 as shown in the following table.

Address			Name	Function
RA2	RA1	RA0		
0	0	0	1278 instruction register	Sets the 1278 core command and RAM address.
0	0	1	1278 data register	Writes to the 1278 character generator RAM and display data RAM.
0	1	0	Not used	
1	1	0	Not used	
1	0	0	LED address register	Sets the LED display register address.
1	0	1	LED data register	Writes to the LED display address.
1	1	0	Expanded output port register	Controls the expanded output ports.
1	1	1	Test mode register	Used for factory inspection prior to delivery.

LED address and data registers

These five, 8-bit registers control an external 5 × 8-LED display. When a display data bit is set, the corresponding LED is ON. The following table shows the relationships

between the registers, the LED output drivers and the output ports associated with each LED.

LED address register			LED data register								Row output pin
DB2	DB1	DB0	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0									LE1
0	0	1									LE2
0	1	0									LE3
0	1	1									LE4
1	0	0									LE5
Column output pin			SWS8	SWS7	SWS6	SWS5	SWS4	SWS3	SWS2	SWS1	

Note: LED address register bits DB3 to DB7 are ignored.

For example, the following table shows the address and data sequence to turn ON the two LEDs connected between LE3 and SW3, and LE3 and SW7.

Step	Address			Data							
	RA2	RA1	RA0	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	0	0	x	x	x	x	x	0	1	0
2	1	0	1	0	1	0	0	0	1	0	0

Note: x = don't care

When LED data is written continuously, the LED address register increments automatically.

Expanded output port register

This 2-bit register contains the data output on the EO1 and EO2 expanded output ports as shown in the following table.

Expanded output port data register							
DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
x	x	x	x	x	x	EO2	EO1

Note: x = don't care

For example, the following table shows the address and data to set EO1 to LOW and EO2 to HIGH.

Address			Data							
RA2	RA1	RA0	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	0	x	x	x	x	x	x	1	0

Note: x = don't care

Test mode register

This register is used to factory test the SED1280 prior to delivery. It is initialized by momentarily holding \overline{RST} LOW.

1278 instruction register

The following table shows the 1278 instructions.

Instruction	Code								Cycles	Description
	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Display Clear	0	0	0	0	0	0	0	1	1640	Clears the entire display and resets the display data RAM address counter.
Cursor Home	0	0	0	0	0	0	1	×	1640	Resets the display data RAM address counter and returns a shifted display to its original position. The RAM contents are not changed.
Set Entry Mode	0	0	0	0	0	1	I/D	S	40	Enables the display shift and sets the display shift direction.
Display Attributes	0	0	0	0	1	D	C	B	40	Bit D enables/disables the entire screen, bit C enables/disables the cursor and bit B enables/disables character blinking at the cursor position.
Cursor/display Shift	0	0	0	1	S/C	R/L	×	×	40	Shifts the display when a cursor move that does not alter the display data RAM occurs.
System Setup	0	0	1	IF	N	F	×	×	40	Bit iF sets the interface data length, bit N the number of display rows, and bit F, the font.
Select CGRAM	0	1	Character generator RAM address						40	Sets. the CGRAM address. Successive write instructions will address CGRAM.
Select DDRAM	1	Display data RAM address						40	Sets the DDRAM address. Successive write instructions will address DDRAM.	

Note: × = don't care

The control bit functions are shown in the following table.

Control bit	Function	
	0	1
I/D	Decrement	Increment
S	No display shift	Display shift
S/C	Cursor movement	Display shift
R/L	Left shift	Right shift
IF	4-bit interface	8-bit interface
N	One row	Two rows
F	5 × 7 pixels	5 × 10 pixels

1278 data register

This register is used for writing data to the 1278 display data (DD) RAM and character generator (CG) RAM. Data is written to DDRAM when a Select DDRAM instruction is executed before a Select CGRAM instruction, and written to CGRAM when a Select CGRAM instruction is executed.

Key Scanning

An 8 × 10-key matrix can be scanned using SWS1 to SWS8 scan outputs and SWC1 to SWC10 scan inputs. The SWS1 timing during one scan interval and SWS1 to SWS8 timing during several scans are shown in the following figures.

Key scan initialization

A key scan starts automatically once the first block of data is received from the host, after a reset. The 5 ms scan cycle runs continuously, once started, as shown in the following figure.

Expanded Input Ports

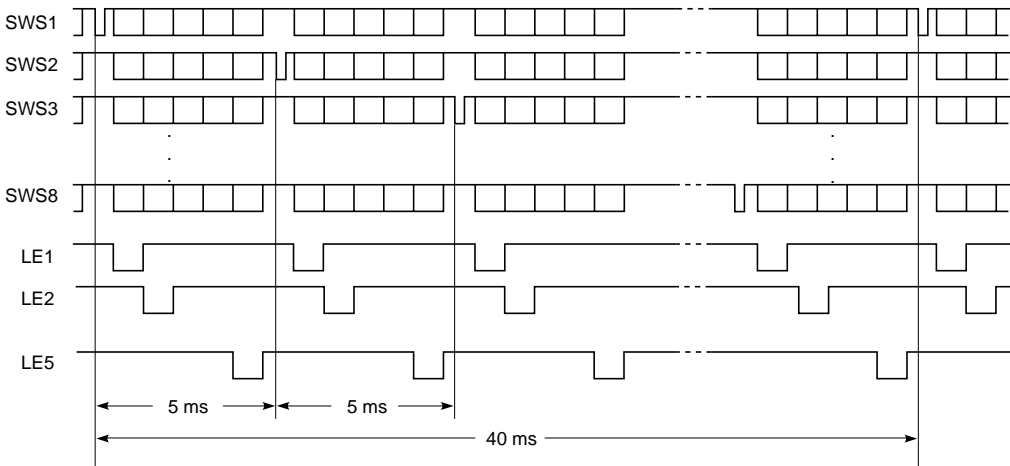

Scanning of the EO1 to EO3 expanded input ports starts automatically once the first block of data is received from the host, after a reset.

LED Controller

Up to 40 LEDs can be connected to SWS1 to SWS8 and LE1 to LE5 to form an 8 × 5 matrix. To control the LEDs, LE1 to LE5 are connected to the based of external pnp transistors, and SWS1 to SWS8, to the LED anodes.

LED controller timing

The LED controller timing for one scan and a series of scans is shown in the following figures.

LED controller limits

Up to 25 mA can be drawn from any one of SWS1 to SWS8 with a maximum total of 100 mA for all eight pins. As the SED1280 does not current limit its outputs, the host should limit the number of LEDs that are ON simultaneously. For example, if a LED draws 5 mA, a maximum of 20 LEDs can be ON simultaneously.

DESIGN INFORMATION

Although the SED1280 contains an SED1278 core, there are some important differences. The following points should be noted when designing a system using an SED1280.

System Clock

The 1 MHz SED1280 system clock is divided by four to generate the 250 kHz clock used by the SED1278 core. Accordingly, the SED1278 requires four times as many clock cycles as the SED1280 to execute the same instruction. The system clock must be connected, even if data transfer or key scanning is not used.

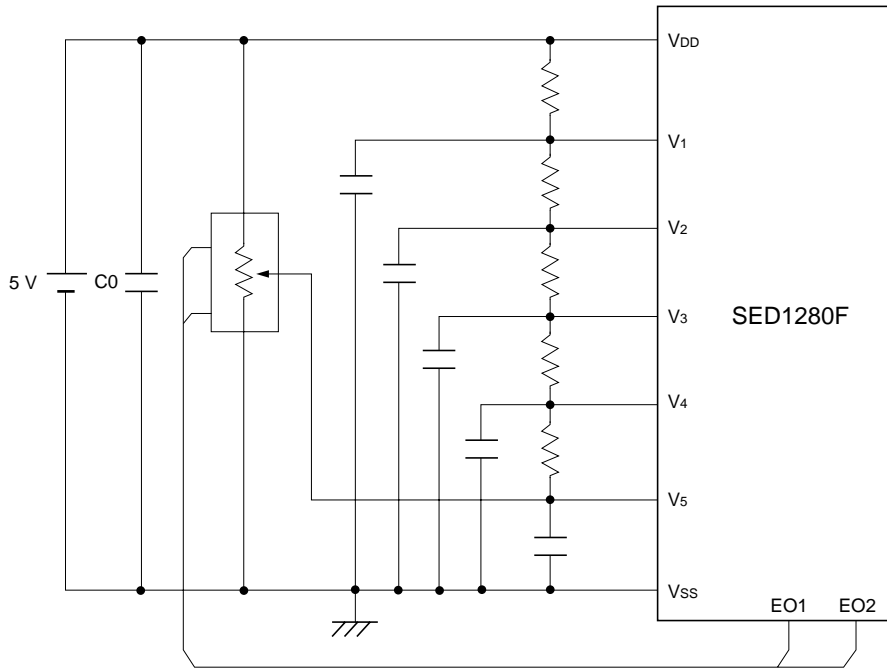

Data Interface

The SED1280 core data interface is eight bits wide. The SED1278 interface width is set to eight by setting the IF bit in the System Set instruction to 1.

Data Output

The SED1280 does not support the SED1278 function allowing the host to read the DDRAM and CGRAM address counter. The SED1280 does, however, provide the ST1 busy bit output, which can be read by the host.

APPLICATION CIRCUITS
LCD Controller Resistor Divider

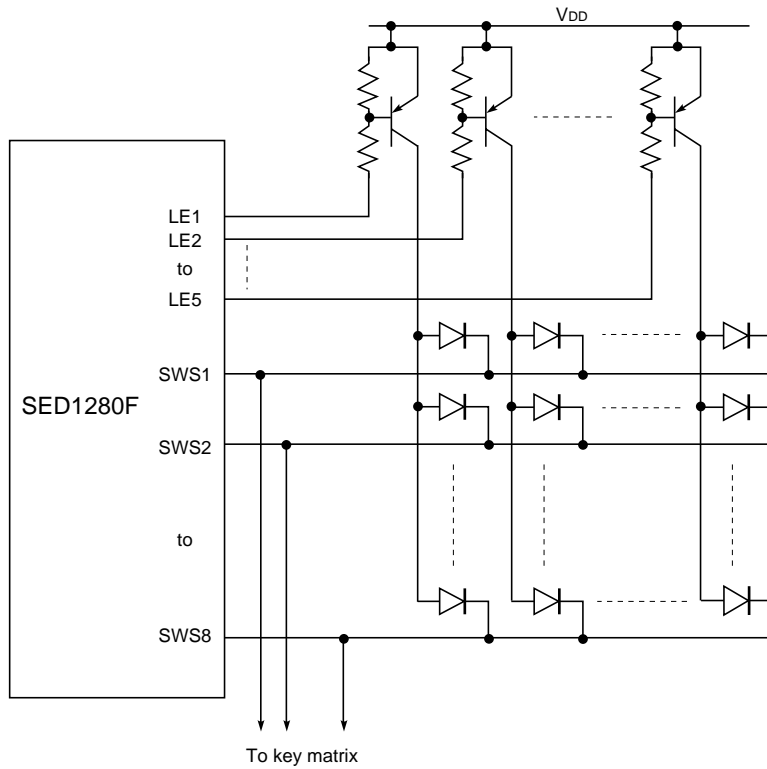

Note: C0 is connected between VDD and VSS to prevent noise, and should be 0.1 μ F or greater.

LCD Connections (2 × 20 character, 5 × 7 dots/character)

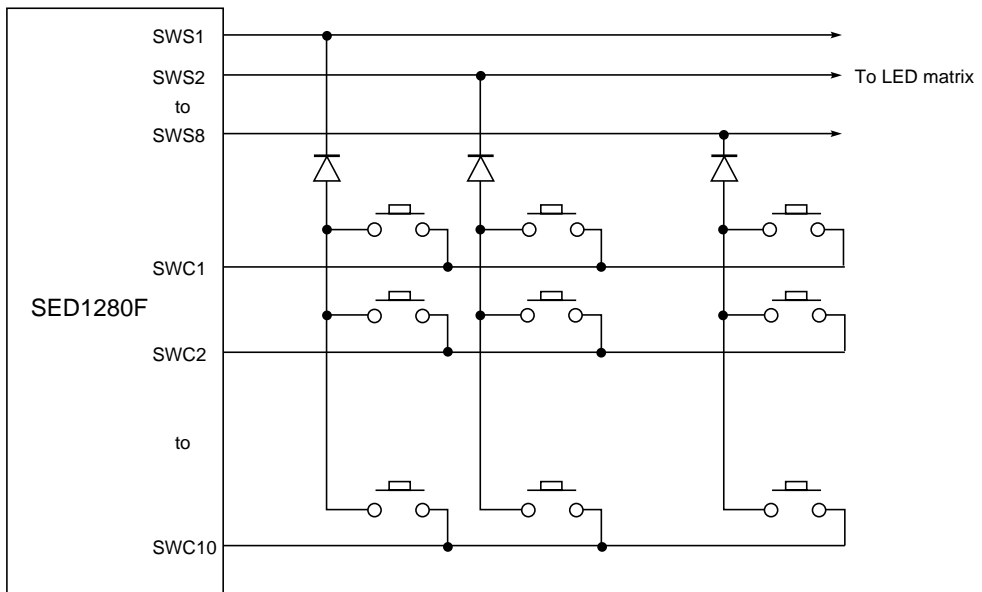

Note: SEG60 to SEG63 and DO1 are open.

LED Matrix Connections

Key Switch Matrix Connections

Note: Do not press two or more keys simultaneously.
