

## LOOK-AHEAD CARRY GENERATOR

## FEATURES

- Provides carry look-ahead across a group of four ALU's
- Multi-level look-ahead for high-speed arithmetic operation over long word length
- Output capability: standard
- ICC category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT182 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT182 carry look-ahead generators accept up to four pairs of active LOW carry propagate ( $\bar{P}_0, \bar{P}_1, \bar{P}_2, \bar{P}_3$ ) and carry generate ( $G_0, G_1, G_2, G_3$ ) signals and an active HIGH carry input ( $C_n$ ). The devices provide anticipated active HIGH carries ( $C_{n+x}, C_{n+y}, C_{n+z}$ ) across four groups of binary adders.

The "182" also has active LOW carry propagate ( $\bar{P}$ ) and carry generate ( $\bar{G}$ ) outputs which may be used for further levels of look-ahead.

The logic equations provided at the outputs are:

$$C_{n+x} = G_0 + P_0 C_n$$

$$C_{n+y} = G_1 + P_1 G_0 + P_1 P_0 C_n$$

$$C_{n+z} = G_2 + P_2 G_1 + P_2 P_1 G_0 + P_2 P_1 P_0 C_n$$

$$\bar{G} = G_3 + P_3 G_2 + P_3 P_2 G_1 + P_3 P_2 P_1 G_0$$

$$\bar{P} = \bar{P}_3 P_2 P_1 P_0$$

The "182" can also be used with binary ALU's in an active LOW or active HIGH input operand mode. The connections to and from the ALU to the carry look-ahead generator are identical in both cases.

| SYMBOL            | PARAMETER                                                                                               | CONDITIONS                                      | TYPICAL |     | UNIT |

$GND = 0 \text{ V}$ ;  $T_{amb} = 25^\circ \text{C}$ ;  $t_r = t_f = 6 \text{ ns}$

## Notes

1. CPD is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = CPD \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz  $C_L$  = output load capacitance in pF

$f_o$  = output frequency in MHz

$V_{CC}$  = supply voltage in V

$\Sigma (C_L \times V_{CC}^2 \times f_o)$  = sum of outputs

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$

For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5 \text{ V}$

## PACKAGE OUTLINES

16-lead DIL; plastic (SOT38Z).

16-lead mini-pack; plastic (SO16; SOT109A).

## PIN DESCRIPTION

| PIN NO.     | SYMBOL                     | NAME AND FUNCTION                   |

## DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see chapter "HCMOS family characteristics", section "Family specifications".

Output capability: standard

I<sub>CC</sub> category: MSI

## Note to HCT types

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

| INPUT                                                   | UNIT LOAD COEFFICIENT |
|---------------------------------------------------------|-----------------------|
| $\bar{G}_0, \bar{G}_1, \bar{P}_0, \bar{P}_1, \bar{P}_2$ | 1.50                  |
| $\bar{G}_3$                                             | 0.30                  |
| $\bar{G}_2, \bar{P}_3, C_n$                             | 1.25                  |

## AC CHARACTERISTICS FOR 74HCT

GND = 0 V;  $t_r = t_f = 6$  ns;  $C_L = 50$  pF
