

TENTATIVE TOSHIBA HYBRID DIGITAL INTEGRATED CIRCUIT
8,388,608-WORD BY 64-BIT SYNCHRONOUS DRAM MODULE
DESCRIPTION

The THLY648021BFG is a 8,388,608-word by 64-bit synchronous dynamic RAM module consisting of eight TC59S6416BFT/BFTL DRAMs on a printed circuit board.

FEATURES

- 8,388,608-word by 64-bit organization
- Single power supply of 3.3 V ± 0.3 V
- Pipeline architecture
- Auto-Refresh and Self-Refresh capability
- All inputs and outputs LVTTTL-compatible
- 4096 Refresh cycles per 64 ms
- Package: 144-pin small-outline DIMM (gold contacts)
- JEDEC Standard

	-80	-10
t _{CK} Clock Cycle Time (CL = 2)	10 ns	12 ns
t _{RAS} Active-to-Precharge Command Period (min)	48 ns	60 ns
t _{AC} Access Time from CLK (CL = 2)	6 ns	8 ns
t _{RC} Ref/Active-to-Ref/Active Command Period (min)	68 ns	84 ns

PIN ASSIGNMENT (TOP VIEW)

PIN NAMES

A0 ~ A11	Address Inputs
BA0, BA1	Bank Select
DQ0 ~ DQ63	Data Inputs/Outputs
/CS0, /CS1	Chip Select
/RAS	Row Address Strobe
/CAS	Column Address Strobe
/WE	Write Enable
DQMB0 ~ DQMB7	Output Disable / Write Mask
CLK0, CLK1	Clock Input
CKE0, CKE1	Clock Enable
SDA	Serial Data / Address for PD
SCL	Clock for PD
VDD	Power (+3.3 V)
VSS	Ground
NC	No Connection

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to foreign exchange and foreign trade control laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

t_{CMS}	Command Set-up Time	2		2.5				
t_{CMH}	Command Hold Time	1		1				
t_{REF}	Refresh Time		64		64	ms		
t_{RSC}	Mode Register Set Cycle Time	16		20		ns		

* CL is \overline{CAS} latency.

NOTES:

1. Conditions outside the limits listed under Absolute Maximum Ratings may cause permanent damage to the device.
2. All voltages are referenced to Vss.
3. These parameters depend on the cycle rate and their values are measured at the cycle rate obtained using the minimum values of t_{CK} and t_{RC} . Input signals are changed once during t_{CK} .
4. These parameters depend on the output loading. The specified values are obtained with the output open.
5. These values are measured with the following conditions.
 - Front side (or back side) : the measuring conditions on the data sheet
 - Back side (or front side) : Stand by (measured with I_{CC2} conditions)

6. AC TEST CONDITIONS

Reference Level for Output Signals	1.4 V/1.4 V
Output Load	See the diagram for AC Test Load (B) below
Input Signal Levels	2.4 V/0.4 V
Transition Time (Rise and Fall) of Input Signals	2 ns
Reference Level of Input Signals	1.4 V

7. Transition times are measured between the V_{IH} and V_{IL} levels. The transition (rise and fall) of input signals has a fixed slope.
8. t_{HZ} defines the time at which the outputs go open circuit and are not reference levels.
9. These parameters are specified for a given number of clock cycles and a given operating frequency. The relation-ship between the number of clock cycles, the timing value and the frequency (a clock period) is as follows:
 - number of clock cycles = specified timing value / clock period
 - (Fractions are rounded up to a whole number.)

10. t_{CH} is the pulse width of CLK measured from the positive edge to the negative edge and referenced to V_{IH} (min). t_{CL} is the pulse width of CLK measured from the negative edge to the positive edge and referenced to V_{IL} (max).

11. Power-up Sequence

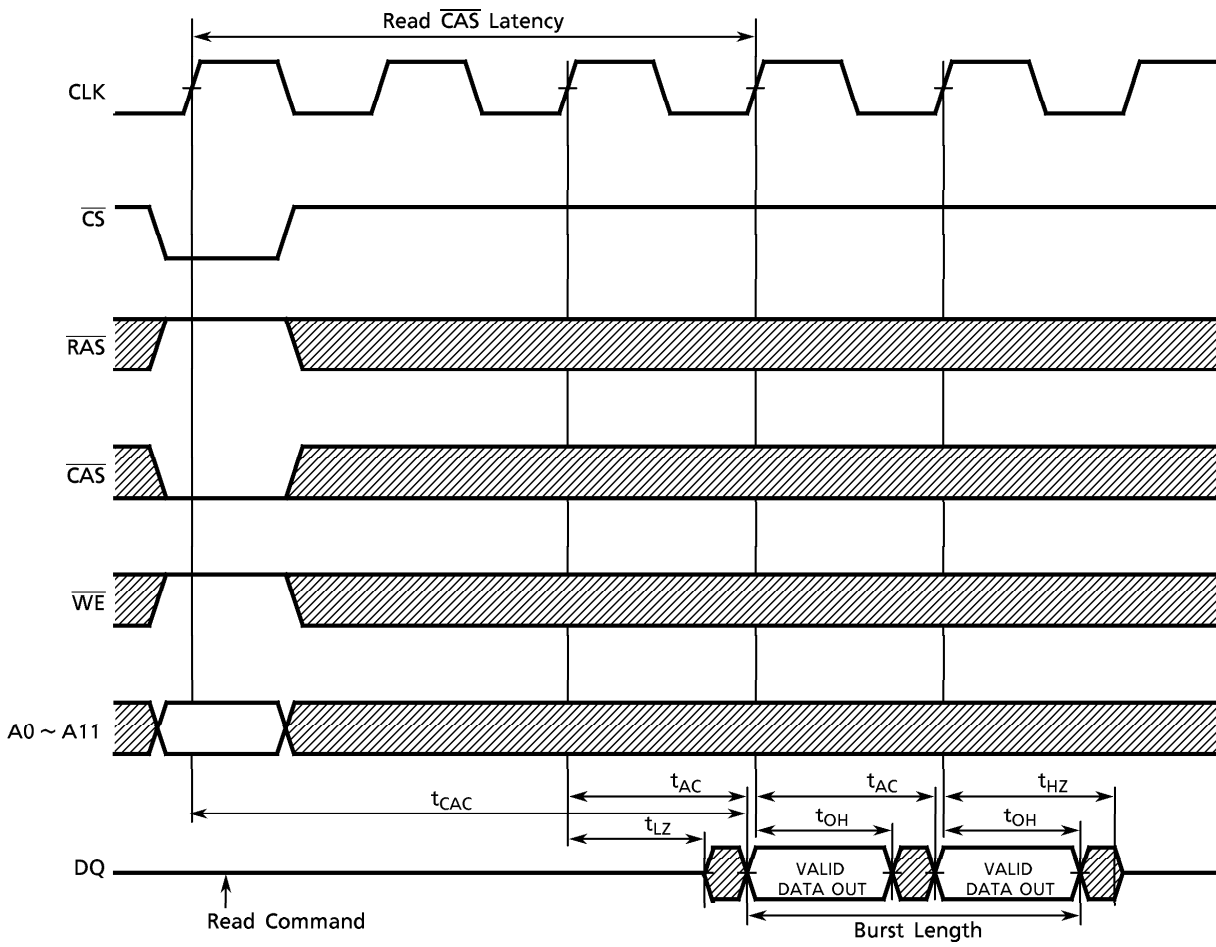

Power-up must be performed in the following sequence.

- 1) Power must be applied to V_{DD} and V_{DDQ} (simultaneously) with all input signals held in the NOP state. The CLK signal must be started at the same time as power is applied.
- 2) After power-up a pause of at least 200 μ seconds is required. Then, DQMB and CKE must be held High (at the V_{CC} level) to ensure that the DQ output is High-impedance.
- 3) Both banks must be precharged.
- 4) The Mode Register Set command must be asserted to initialize the Mode register.
- 5) An Auto-Refresh operation, consisting of at least eight Auto-Refresh cycles, must be performed.

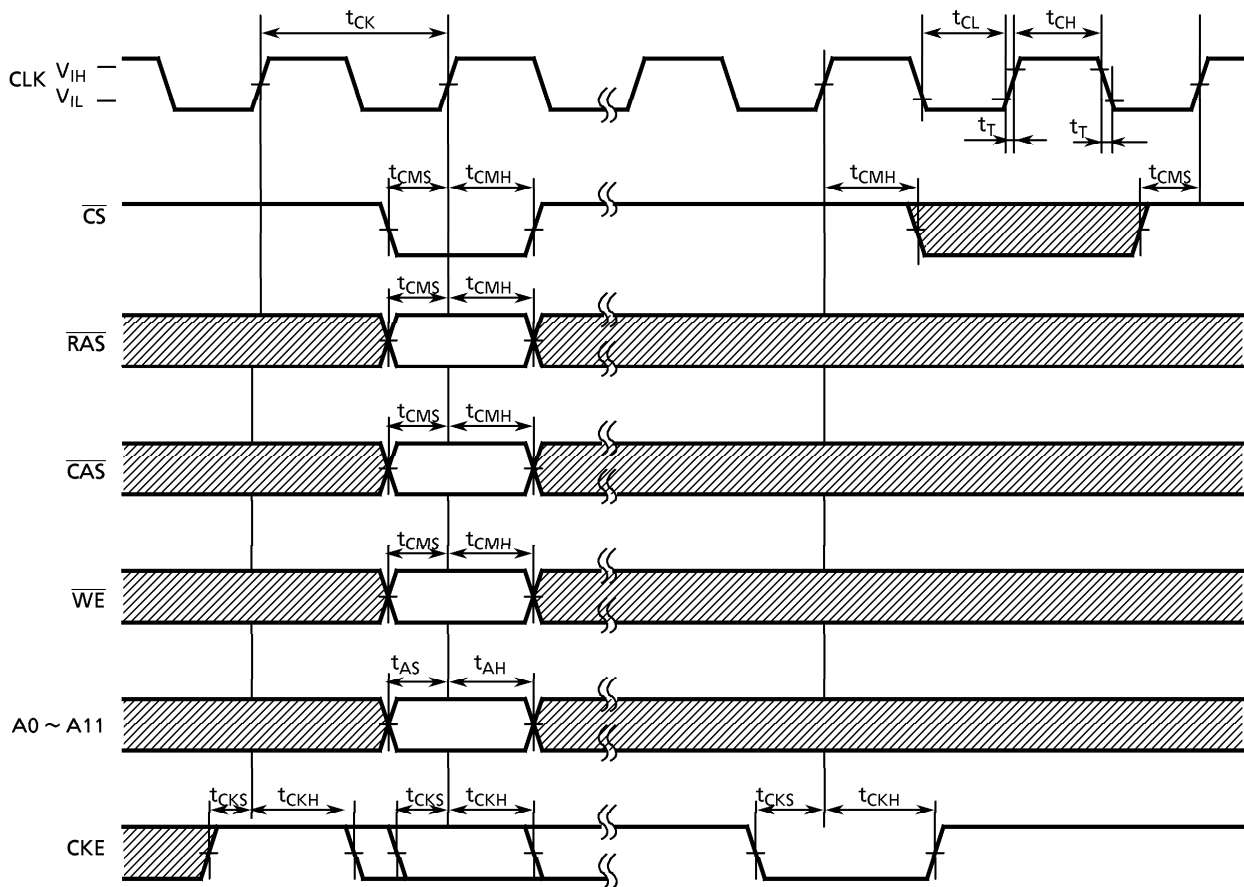

The order in which 4) and 5) are performed is interchangeable.
