Preface

Conventions

- Numeric formats follow the rules as shown below:
  Hexadecimal: 0xABC
  Decimal: 123 or 0d123 – Only when it needs to be explicitly shown that they are decimal numbers.
  Binary: 0b111 – It is possible to omit the "0b" when the number of bit can be distinctly understood from a sentence.
- "_N" is added to the end of signal names to indicate low active signals.
- It is called "assert" that a signal moves to its active level, "deassert" to its inactive level.
- When two or more signal names are referred, they are described like as [m: n].
  Example: S[3: 0] shows four signal names S3, S2, S1 and S0 together.
- The characters surrounded by ***[ ]*** defines the register.
  Example: ***[ABCD]***
- "n" substitutes suffix number of two or more same kind of registers, fields, and bit names.
  Example: ***[XYZ1]***, ***[XYZ2]***, ***[XYZ3]*** → ***[XYZn]***
- "x" substitutes suffix number or character of units and channels in the Register List.
  In case of unit, "x" means A, B, and C ...
  Example: ***[ADACR0]***, ***[ADBCR0]***, ***[ADCCR0]*** → ***[ADxCR0]***
  In case of channel, "x" means 0, 1, and 2 ...
  Example: ***[T32A0RUNA]***, ***[T32A1RUNA]***, ***[T32A2RUNA]*** → ***[T32AxRUNA]***
- The bit range of a register is written like as [m: n].
  Example: Bit[3: 0] expresses the range of bit 3 to 0.
- The configuration value of a register is expressed by either the hexadecimal number or the binary number.
  Example: ***[ABCD]***<EFG> =0x01 (hexadecimal), ***[XYZn]***<VW> =1 (binary)
- Word and Byte represent the following bit length.
  Byte: 8 bits
  Half word: 16 bits
  Word: 32 bits
  Double word: 64 bits
- Properties of each bit in a register are expressed as follows:
  R: Read only
  W: Write only
  R/W: Read and Write are possible
- Unless otherwise specified, register access supports only word access.
- The register defined as reserved must not be rewritten. Moreover, do not use the read value.
- The value read from the bit having default value of "-" is unknown.
- When a register containing both of writable bits and read-only bits is written, read-only bits should be written with their default value, In the cases that default is "-", follow the definition of each register.
- Reserved bits of the Write-only register should be written with their default value.
  In the cases that default is "-", follow the definition of each register.
- Do not use read-modified-write processing to the register of a definition which is different by writing and read out.

	Pin name	Function
Power Supply	DVDD5A (Note1) DVDD5B (Note1)	Power supply pin for digital DVDD5A/B supplies the power to the following pins: PA to PH, PN, PP, PR, PT to PW, MODE, RESET_N, BOOT_N A power supply is supplied to an oscillating circuit from a built-in regulator. X1, X2
	DVSSA (Note2) DVSSB (Note2) DVSSC (Note2)	GND pin for digital
	REGOUT1 (Note3)	Capacitor for a regulator connection pin (Note4)
	REGOUT2 (Note3)	Capacitor for a regulator connection pin (Note4)
	AVDD5 VREFH	Power supply pin for analog and reference power pin for analog (VREFH). AVDD5 supplies the power to the following pins: PL, PM, PK, PJ
	AVSS VREFL	GND pin for analog and reference GND pin for analog (VREFL)

Note1: Apply the voltage to DVDD5A and DVDD5B at the same potential except the case that the pins are not provided.

Note2: Apply the external voltage to DVSSA, DVSSB, and DVSSC at the same potential except the case that the pins are not provided.

Note3: For REGOUT1 and REGOUT2, do not cause a short circuit with DVDD5A, DVDD5B, or DVSSA, DVSSB, or DVSSC.

Note4: For the capacitor value, refer to the "7.Electrical Characteristics"

4.1.5. Capacitors between power supply pins

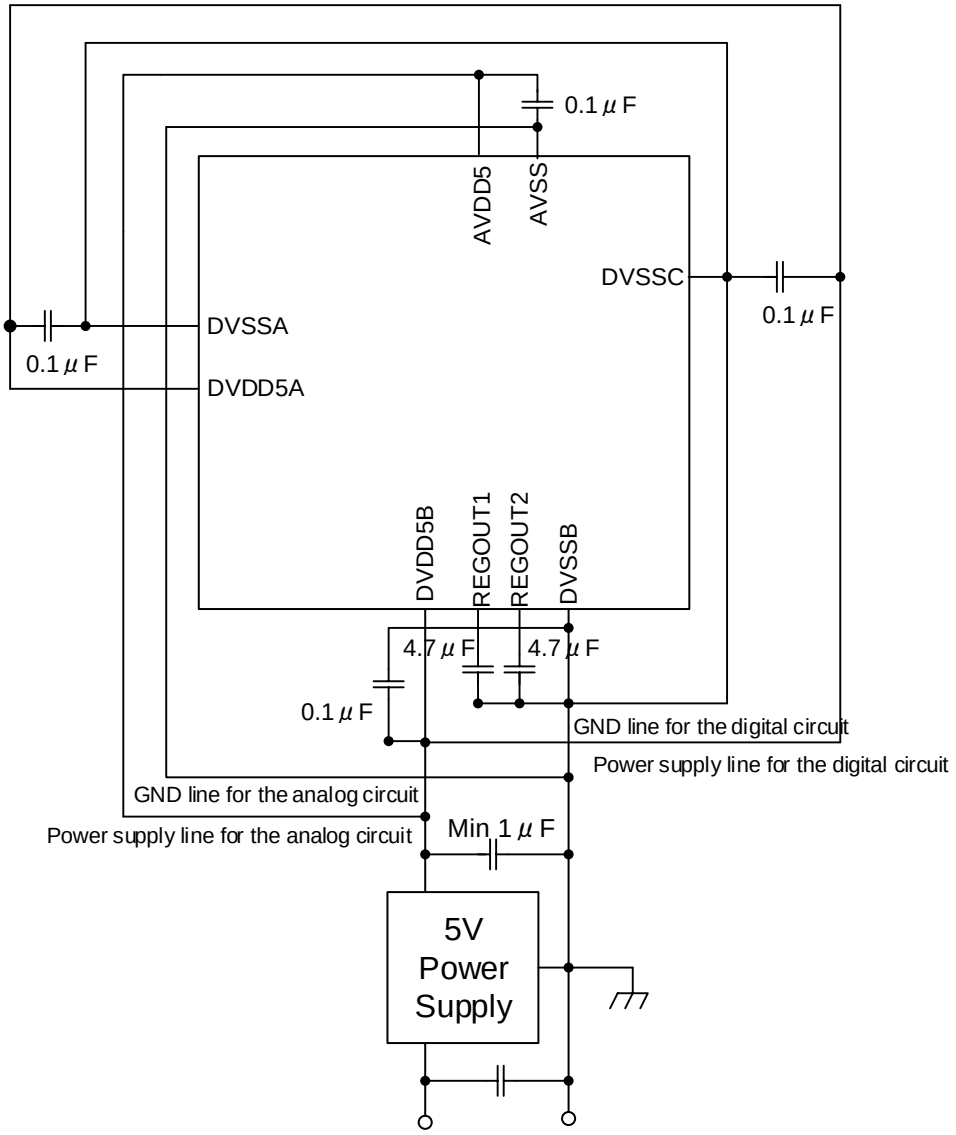

Figure 4.1 Capacitors for power supply pins connection circuit

Note1: 5V power supply output capacitor (min 1 µF) must be placed on the shortest distance from the DVDD5B, DVSSB.

Note2: 5V power supply and GND lines must be separated for the analog circuit and the digital circuit in near 5V power supply output capacitor (min 1 µF) between this capacitor and DVDD5B, DVSSB.

Note3: Power supply and GND lines must be bring close and be wired. When they are away, a power supply loop makes for power supply and GND lines through the capacitor of a power supply circuit, and they will be the antenna received high frequency noise.

Note4: Capacitors of REGOUT1 and REGOUT2 for regulators must be same capacity, and they must be placed on the shortest distance from DVSSB.

Note5: Use multilayer ceramic capacitors for the power supply output capacitor (1 µF or more) and regulator capacitors (4.7 µF).

4.2. Functional Pin and Ports Assignment (Pin Number)

Following table shows a pin number of the port assignment and each product which were seen from the functional pin.

"-" means that it not have a pin or there is no assignment of a function.

5.2. Processor Core

The TMPM4K Group(2) incorporates a high-performance 32-bit processor core (Arm Cortex-M4 processor with FPU).

For the operation of the processor core, refer to the Arm documentation set for "Cortex-M series processors". This section explains the product-specific information.

5.2.1. Core Information

The Cortex-M4 processor with FPU revision used in the TMPM4K Group(2) is shown as below:

For details of the CPU core and the architecture, refer to the documentation of the Arm in the following URL:

http://infocenter.arm.com/help/index.jsp

Table 5.2 Core revision

Group name	Core revision
TMPM4K Group(2)	r0p1

5.2.2. Configurable Options

In the Cortex-M4 processor with FPU, some blocks can be selected to implement. The following table shows the configurations of the TMPM4K Group(2).

Table 5.3 Configurable options and their implementations

Configurable option	Implementation
FWB	Literal comparator: 2 Instruction comparator: 6
DWT	Comparator: 4
ITM	Available
MPU	Available
ETM	Available
AHB-AP	Available
AHB trace macro cell interface	Not available

5.3. Clock Control and Operation Mode (CG)

The CG selects a clock gear ratio and the prescaler clock, or warm up time of the oscillator.

There are NORMAL mode and low-power consumption mode as operation modes. Power consumption can be decreased by mode transition.

The system clock consists of "High speed system clock" and "Middle speed system clock". The former is a high speed oscillation clock and the latter is generated by dividing High speed system clock.

The outline of the clock/mode control circuit is as follows:

- Internal high speed oscillator: 10MHz
- Selectable from the external high speed oscillator or internal high speed oscillator.
- PLL (Clock Multiplication Circuit)

  For System clock, Capable of 160 MHz output by changing the multiplication ratio according to the frequency of the high speed oscillation circuit.
- Clock gear:

  The high speed clock can be divided by 1/1, 1/2, 1/4, 1/8, or 1/16 and the clock is used as the system clock (fsys).
- Low-power consumption mode:

  IDLE: Only the CPU is stopped in this mode. Each peripheral circuit can enable or disable operation in the IDLE mode.

  STOP1: The system clock is stopped in this mode.

5.4. Flash Memory (Code FLASH, Data FLASH)

TMPM4K Group(2) has 512KB/256KB/128KB of Code flash and 32KB of Data flash.

The code flash stores instruction code, and CPU reads instruction code and executes. The data flash stores data, and even if a power supply is off, data can be kept.

It has the dual mode that possible to write and erase data flash while executing an order by a code flash. And it's also possible to continue executing an application program during writing or erasing data flash memory.

It has protection function which prohibits write or erase by the block unit and it has the security function which prohibits the reading of the program code by the 3rd person.

5.5. Oscillator

External High Speed Oscillator (EHOSC):

Connect crystal resonator or ceramic resonator to terminals. Use clock source for System clock.

Internal High Speed Oscillator 1 (IHOSC1):

The oscillation frequency is 10MHz. Use clock source for System clock.

Internal High Speed Oscillator 2 (IHOSC2):

The oscillation frequency is 10MHz. Use clock source for OFD and SIWDT.

EHOSC	✓	✓	✓	✓	✓
IHOSC1	✓	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.6. Trimming Circuit (TRM)

The TRM can adjust oscillation frequency of the internal high speed oscillator (IHOSC1).

Table 5.5 Built-in TRM

TRM	✓	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.7. Oscillation Frequency Detection Circuit (OFD)

The OFD is a function that detects an abnormal state of the clock. It measures the external high speed oscillation (f_{EHOSC}) or high speed clock (fc) based on the internal reference clock (f_{IHOSC2}). If an oscillation or clock frequency is out of the specified range, a reset signal occurs.

The upper limit and the lower limit of detection frequency ranges can be specified respectively.

OFD	✓	✓	✓	✓	✓

Note: ✓: Available, -: N/A

5.8. Voltage Detection Circuit (LVD)

The LVD is a peripheral function that detects whether a power supply voltage is lower or higher than the preset voltage. When a low voltage or higher voltage than the preset voltage is detected, the LVD generates an interrupt request or reset the MCU.

Setting voltage can be chosen from eight kinds. LVD is set to enable from the Reset state at the Power on.

θja: Thermal resistance of the package (°C/W)

Please refer to Table 7.2.

The calculation formula for maximum allowable power (PD(Max)) is shown below.

$PD(Max) = V_{DD} \times I_{DD}(Max) + \sum(I_{OL} \times V_{OL}) + \sum((V_{DD} - V_{OH}) \times |I_{OH}|)$

I_{OL}: "Low" level output current

The AC characteristics are the result under the measurement conditions below:

- DVDD5=AVDD5= 2.7 to 5.5 V
- Ta = -40 to 105°C
- Output level: High = 0.8 × DVDD5, Low = 0.2 × DVDD5
- Input level: High = 0.75 × DVDD5, Low = 0.25 × DVDD5
- Load capacity: CL = 30pF

Note: DVDD5 is a generic name for DVDD5A, and DVDD5B.

7.9.1.2. AC Electrical Characteristics

"T" indicates an operation clock cycle of the TSPI. This operation clock has the same cycle of the system clock (fsysm). This cycle depends on the clock gear setting.

The number of cycles can be 1 to 16. It is specified with TSPIxSCK. The value of "k1" is specified with ***[TSPIxFMTR0]***<CSSCKDL[3:0]>; the value of "k2" is specified with ***[TSPIxFMTR0]***<SCKCSDL[3:0]>. These values are 1 to 16.

7.9.2. I²C Interface (I²C)

7.9.2.1. AC Measurement Conditions

The AC characteristics are the result of the measurement conditions below:

- DVDD5=AVDD5= 2.7 to 5.5 V
- Ta = -40 to 105°C
- Output level: Low = 0.4V
- Input level: High = 0.7 × DVDD5, Low = 0.3 × DVDD5
- Load capacity: CL = 30pF

Note: DVDD5 is a generic name for DVDD5A, and DVDD5B.

7.9.2.2. AC Electrical Characteristics

"T" indicates an operation clock cycle of the I²C. This operation clock has the same cycle of the system clock (fsysm). This cycle depends on the clock gear setting.

"n" indicates a frequency of SCL output clock specified with ***[I2CxCR]***<SCK>.

"p" indicates a prescaler division ratio specified with ***[I2CxPRS]***<PRSCK>.

Parameter	Symbol	Standard mode		Fast mode		Unit
		Min	Max	Min	Max	
SCL clock frequency	f_{SCL}	0	100	0	400	kHz
Start condition hold time	$t_{HD, STA}$	4.0	-	0.6	-	μs
SCL clock Low width (Input) (Note1)	t_{LOW}	4.7	-	1.3	-	
SCL clock High width (Input) (Note2)	t_{HIGH}	4.0	-	0.6	-	
Re-start condition setup time (Note5)	$t_{SU, STA}$	4.7	-	0.6	-	
Data hold time (Input) (Note3, 4)	$t_{HD, DAT}$	0	-	0	-	
Data setup time	$t_{SU, DAT}$	250	-	100	-	ns
Stop condition setup time	$t_{SU, STO}$	4.0	-	0.6	-	μs
Bus free time between stop condition and start condition (Note5)	t_{BUF}	4.7	-	1.3	-	

Note1: SCL clock low level width (output): $p \times (2^{n+1}+10)/T$ (***[I2CxOP]***<NFSEL>=0)

Note2: SCL clock high level width (output): $p \times (2^{n+1}+6)/T$ (***[I2CxOP]***<NFSEL>=0)
On I²C bus standard, the maximum speed of standard mode/fast mode is 100kHz/400 kHz respectively. Note that an internal SCL clock frequency is determined by the fsys and the calculation of Note1 and Note2 above-mentioned.

Note3: The data hold time (output) is equal to four cycles of the prescaler clock (Tprsck) started from the internal SCL.

Note4: On I²C bus standard, it is described that a data internal hold time should be set at least 300 ns to avoid unstable condition on the falling of the SCL when the SDA is input; however, this precaution is not supported in this MCU. Also, the edge slope control function for the SCL is not available. Therefore, when the customer designs the MCU, make sure to follow the data hold time (input) in the table above. Note that t_r/t_f on the SCL/SDA should be included in the data hold time.

Note5: Depends on software.

7.12.3. Oscillation Circuit

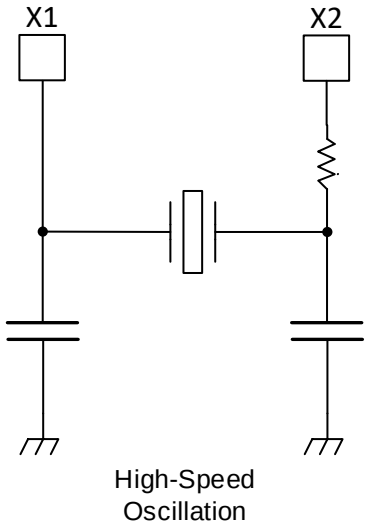

Figure 7.11 Oscillation circuit sample

To obtain a stable oscillation, load capacity and the position of the oscillator must be configured properly.

Since these factors are strongly affected by substrate patterns, please evaluate oscillation stability using the substrate you use.

This product has been evaluated by the oscillator vendor below. Please refer this information when selecting external parts.

7.12.4. Ceramic Oscillator

This product has been evaluated by the ceramic oscillator by Murata Manufacturing Co., Ltd.
Please refer to the company's website for details.

7.12.5. Crystal Oscillator

This product has been evaluated by the crystal oscillator by KYOCERA Corporation.
Please refer to the company's website for details.

7.12.6. Precautions for designing printed circuit board

Be sure to design printed circuit board patterns that connect a crystal unit with other oscillation elements so that the length of such patterns become shortest possible to prevent deterioration of characteristics due to stray capacitances and wiring inductance. For multi-layer circuit boards, it is important not to wire the ground and other signal patterns right beneath the oscillation circuit. For more information, please refer to the URL of the oscillator vendor.

9. Precautions

This Page explains general precautions on the use of our MCUs.

Note that if there is a difference between the general precautions and the description in the body of the document, the description in the body of the document has higher priority.

(1) The MCUs' operation at power on

At power on, internal state of the MCUs is unstable. Therefore, state of the pins is undefined until reset operation is completed.
When a reset is performed by an external reset pin, pins of the MCUs that use the reset pin are undefined until reset operation by the external pin is completed.
Also, when a reset is performed by the internal power on reset, pins of the MCUs that use the internal power on reset are undefined until power supply voltage reaches the voltage at which power on reset is valid.

(2) Unused pins

Unused input/output ports of the MCUs are prohibited to use. The pins are high-impedance.
Generally, if MCUs operate while the high-impedance pins left open, electrostatic damage or latch-up may occur in the internal LSI due to induced voltage influenced from external noise.
We recommend that each unused pin should be connected to the power supply pins or GND pins via resistors.

(3) Clock oscillation stability

A reset state must be released after the clock oscillation becomes stable. If the clock is changed to another clock while the program is in progress, wait until the clock is stable.
