- 240-Pin Registered Dual In-Line Memory Module (RDIMM)
- 2GB/4GB: 256Mx72/512Mx72 DDR3 Registered DIMM based on 256Mx8 DDR3 SDRAM G-Die devices
- 4GB/8GB: 512Mx72/1024Mx72 DDR3 Registered DIMM based on 512Mx4 DDR3 SDRAM G-Die devices
- Intended for 667MHz/800MHz/933MHz applications
- Inputs and outputs are SSTL-15 compatible
- $V_{DD} = V_{DDQ} = 1.5V \pm 0.075V$ (for DDR3)
- $V_{DD} = V_{DDQ} = 1.35V - 0.0675V / +0.1V$ (for DDR3L)
(Backward Compatible to $V_{DD} = V_{DDQ} = 1.5V \pm 0.075V$)
- SDRAMs have 8 internal banks for concurrent operation
- Differential clock inputs
- Data is read or written on both clock edges
- DRAM DLL aligns DQ and DQS transitions with clock transitions.
- Address and control signals are fully synchronous to positive clock edge
- Nominal and Dynamic On-Die Termination support
- Programmable Operation:
 - DIMM \overline{CAS} Latency: 5,6,7,8,9,10,11,12,13
 - Burst Type: Sequential or Interleave
 - Burst Length: BC4, BL8
 - Operation: Burst Read and Write
- Two different termination values (Rtt_Nom & Rtt_WR)
- 15/10/1 (row/column/rank) Addressing for 2GB
- 15/11/1 (row/column/rank) Addressing for 4GB (512Mx4 Device)
- 15/10/2 (row/column/rank) Addressing for 4GB (256Mx8 Device)
- 15/11/2 (row/column/rank) Addressing for 8GB
- Extended operating temperature range
- Auto Self-Refresh option
- Serial Presence Detect
- Gold contacts
- SDRAMs are in 78-ball BGA Package
- RoHS compliance and Halogen free

Description

NT2GC72B89G0NL(K) / NT2GC72C89G0NL(K) / NT4GC72B4PG0NL(K) / NT4GC72C4PG0NL(K) / NT4GC72B8PG0NL(K) /

NT4GC72C8PG0NL(K) / NT8GC72B4NG0NL(K) and NT8GC72C4NG0NL(K) are 240-Pin Double Data Rate 3 (DDR3) Synchronous

DRAM Registered Dual In-Line Memory Module, organized as one rank of 256Mx72 (2GB), one rank or two ranks of 512Mx72 (4GB) and two ranks of 1Gx72 (8GB) high-speed memory array. Modules use nine 256Mx8 (2GB) 78-ball BGA packaged devices, eighteen 256Mx8 (4GB) 78-ball BGA packaged devices and thirty-six 512Mx4 (8GB) 78-ball BGA packaged devices. These DIMMs are manufactured using raw cards developed for broad industry use as reference designs. The use of these common design files minimizes electrical variation between suppliers. All NANYA DDR3 SDRAM DIMMs provide a high-performance, flexible 8-byte interface in a 5.25" long space-saving footprint.

The DIMM is intended for use in applications operating of 667MHz/800MHz/933MHz clock speeds and achieves high-speed data transfer rates of 1333Mbps/1600Mbps/1866Mbps. Prior to any access operation, the device \overline{CAS} latency and burst/length/operation type must be programmed into the DIMM by address inputs A0-A14 and I/O inputs BA0-BA2 using the mode register set cycle.

The DIMM uses serial presence-detect implemented via a serial EEPROM using a standard IIC protocol. The first 128 bytes of SPD data are programmed and locked during module assembly. The remaining 128 bytes are available for use by the customer.

Input/Output Functional Description

Symbol	Type	Polarity	Function
CK0, CK1 CK0, CK1	Input	Cross point	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of \overline{CK} . A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock. However, CK1 and $\overline{CK1}$ are terminated but not used on RDIMMs.
CKE0, CKE1	Input	Active High	Activates the DDR3 SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{S0} - \overline{S3}$	Input	Active Low	Enable the command decoders for the associated rank of SDRAM when low and disables decoders when high. When decoders are disabled, new commands are ignored and previous operations continue. Other combinations of these input signals perform unique functions, including disabling all outputs (except CKE and ODT) of the register(s) on the DIMM or accessing internal control words in the register device(s). For modules with two registers, $\overline{S2}$ and $\overline{S3}$ operate similarly to $\overline{S0}$ and $\overline{S1}$ for the second set of register outputs or register control words.
\overline{RAS} , \overline{CAS} , \overline{WE}	Input	Active Low	When sampled at the positive rising edge of CK and falling edge of \overline{CK} , signals \overline{RAS} , \overline{CAS} , \overline{WE} define the operation to be executed by the SDRAM.
ODT0, ODT1	Input	Active High	Asserts on-die termination for DQ, DM, DQS, and \overline{DQS} signals if enabled via the DDR3 SDRAM mode register.
DM0 – DM8	Input	Active High	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
DQS0 – DQS17 $\overline{DQS0} - \overline{DQS17}$	I/O	Cross point	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR3 SDRAM and is sent at the leading edge of the data window. \overline{DQS} signals are complements, and timing is relative to the cross point of respective DQS and \overline{DQS} . If the module is to be operated in single ended strobe mode, all \overline{DQS} signals must be tied on the system board to V_{SS} and DDR3 SDRAM mode registers programmed appropriately.
TDQS9 – TDQS17 $\overline{TDQS9} - \overline{TDQS17}$	Output		TDQS/ \overline{TDQS} is applicable for x8 DRAMs only. When enabled via mode register A11=1 in MR1, DRAM will enable the same termination resistance function on TDQS/ \overline{TDQS} that is applied to DQS/ \overline{DQS} . When disabled via mode register A11=0 in MR1, DM/TDQS will provide the data mask function TDQS is not used. X4/x16 DRAMs must disable the TDQS function via mode register A11=0 in MR1.
BA0, BA1, BA2	Input	-	Selects which DDR3 SDRAM internal bank of four or eight is activated.
A0 – A9 A10/AP A11 A12/ \overline{BC} A13-A14	Input	-	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of \overline{CK} . During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of \overline{CK} . In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ0 – DQ63	Input	-	Data Input/Output pins.
CB0 – CB7	I/O	-	Check bits are used for ECC.
V_{DD} , V_{DDSPD} , V_{SS}	Supply	-	Power supplies for core, I/O, Serial Presence Detect, Temp sensor, and ground for the module.
V_{REFDQ} , V_{REFCA}	Supply	-	Reference voltage for SSTL15 inputs.
SDA	I/O	-	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM and temp sensor. A resistor must be connected from the SDA bus line to V_{DDSPD} on the system planar to act as a pull up.
SCL	Input	-	This signal is used to clock data into and out of the SPD EEPROM and Temp sensor.
SA0 – SA2	Input	-	Address pins used to select the Serial Presence Detect and Temp sensor base address.
\overline{EVENT}	Output	-	The \overline{EVENT} pin is reserved for use to flag critical module temperature.
\overline{RESET}	Input	-	This signal resets the DDR3 SDRAM.
Par_In	Input	-	Parity bit for the Address and Control bus.
$\overline{Err_Out}$	Output	-	Parity error detected on the Address and Control bus. A resistor may be connected from bus line to V_{DD} on the system planar to act as a pull up.

[8GB — 2 Ranks, 512Mx4 DDR3 SDRAMs]

Notes :

1. DQ-to-I/O wiring is shown as recommended but may be changed.
2. ZQ pins of each SDRAM are connected to individual RZQ resistors ($240\Omega \pm 1\%$).
3. See the wiring diagrams for resistor values.

Environmental Requirements

Symbol	Parameter	Rating	Units	Note
H _{OPR}	Operating Humidity (relative)	10 to 90	%	1
T _{STG}	Storage Temperature (Plastic)	-55 to 100	°C	1
H _{STG}	Storage Humidity (without condensation)	5 to 95	%	1
P _{BAR}	Barometric Pressure (operating & storage)	105 to 69	K Pascal	1, 2

Note:

- Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only and device functional operation at or above the conditions indicated is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Up to 9850 ft.

Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Note
V _{DD}	Voltage on VDD pins relative to Vss	-0.4 V ~ 1.975 V	V	1, 3
V _{DDQ}	Voltage on VDDQ pins relative to Vss	-0.4 V ~ 1.975 V	V	1, 3
V _{IN} , V _{OUT}	Voltage on I/O pins relative to Vss	-0.4 V ~ 1.975 V	V	1
T _{STG}	Storage Temperature	-55 to +100	°C	1, 2

Note:

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability
- Storage Temperature is the case surface temperature on the center/top side of the DRAM.
- VDD and VDDQ must be within 300 mV of each other at all times;and VREF must be not greater

Operating temperature Conditions

Symbol	Parameter	Rating	Units	Note
T _{OPER}	Normal Operating Temperature Range	0 to 85	°C	1, 2
	Extended Temperature Range (Optional)	85 to 95	°C	1, 3

Note:

- Operating Temperature TOPER is the case surface temperature on the center / top side of the DRAM.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 to 85 °C under all operating conditions
- Some applications require operation of the DRAM in the Extended Temperature Range between 85 °C and 95 °C case temperature. Full specifications are supported in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 μs. It is also possible to specify a component with 1X refresh (tREFI to 7.8μs) in the Extended Temperature Range. Please refer to supplier data sheet and/or the DIMM SPD for option availability.
 - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b). Please refer to the supplier data sheet and/or the DIMM SPD for Auto Self-Refresh option availability, Extended Temperature Range support and tREFI requirements in the Extended Temperature Range.

DC Electrical Characteristics and Operating Conditions

Symbol	Parameter	Min	Type	Max	Units	Notes
VDD	Supply Voltage	1.425	1.5	1.575	V	1,2
VDDQ	Output Supply Voltage	1.425	1.5	1.575	V	1,2
VDD	Supply Voltage	1.28	1.35	1.45	V	DDR3L
VDDQ	Output Supply Voltage	1.28	1.35	1.45	V	DDR3L

Note:

- Under all conditions VDDQ must be less than or equal to VDD.
- VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.
