Contents

The S-4543A is a dot matrix liquid crystal display driver IC having an 8-bit MPU interface, serial interface, display RAM, CR oscillator, 120 segment driver outputs, and 33 common driver outputs. Since it operates at a low voltage and low current, it is optimum for the LCD drivers for the portable equipment.

■ FEATURES

- Wide operating voltage range

  Logic power supply voltage: -2.4 to -5.5 V
  LCD drive voltage: -2.7 to -11.5 V
- Built-in CR oscillation circuit: 18 kHz
- 120 segments, 32 common driver outputs, one common output for icon
- 8-bit×120-segment×4-page

  +120 segments for Icon
- 1/32 duty or 1/33 duty selectable
- 68 family MPU interface
- Serial interface
- Shipping: TCP
  Bare chip with gold bumps

■ BLOCK DIAGRAM

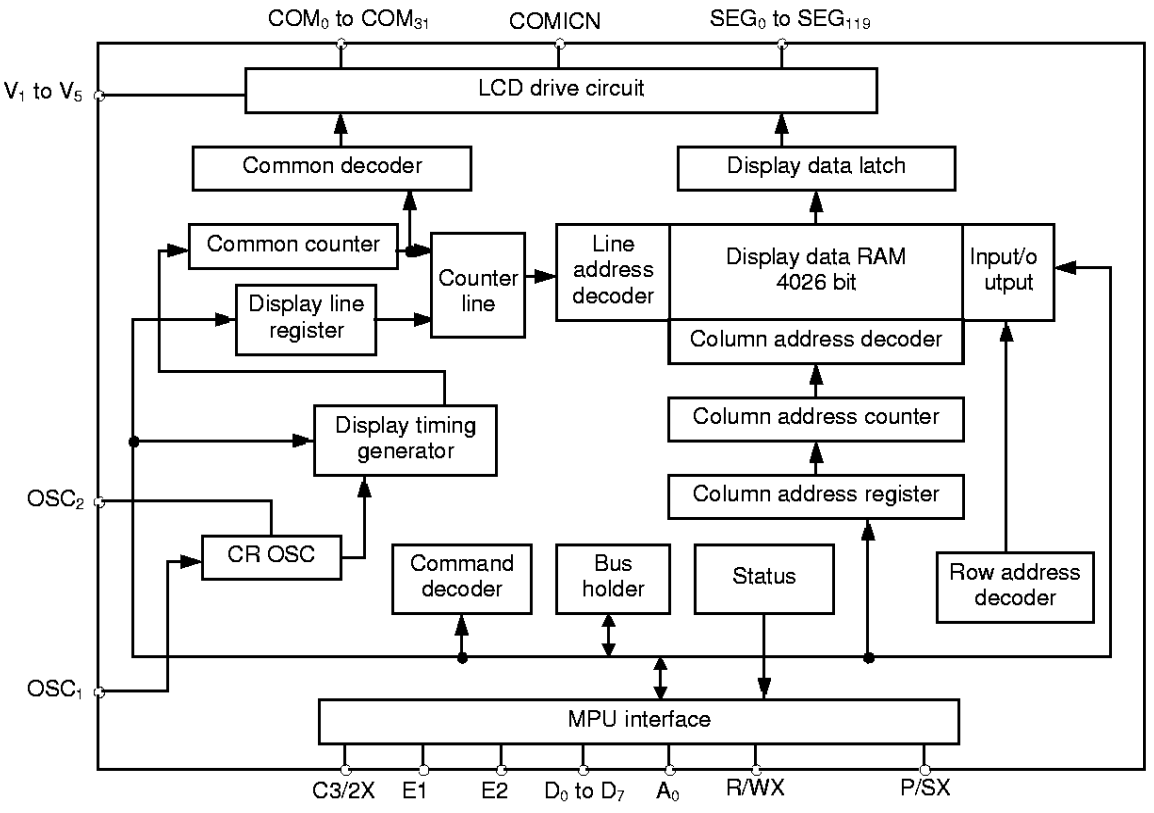

Figure 1 Block Diagram

■ PIN ASSIGNMENT

Table 1 Pin Assignment

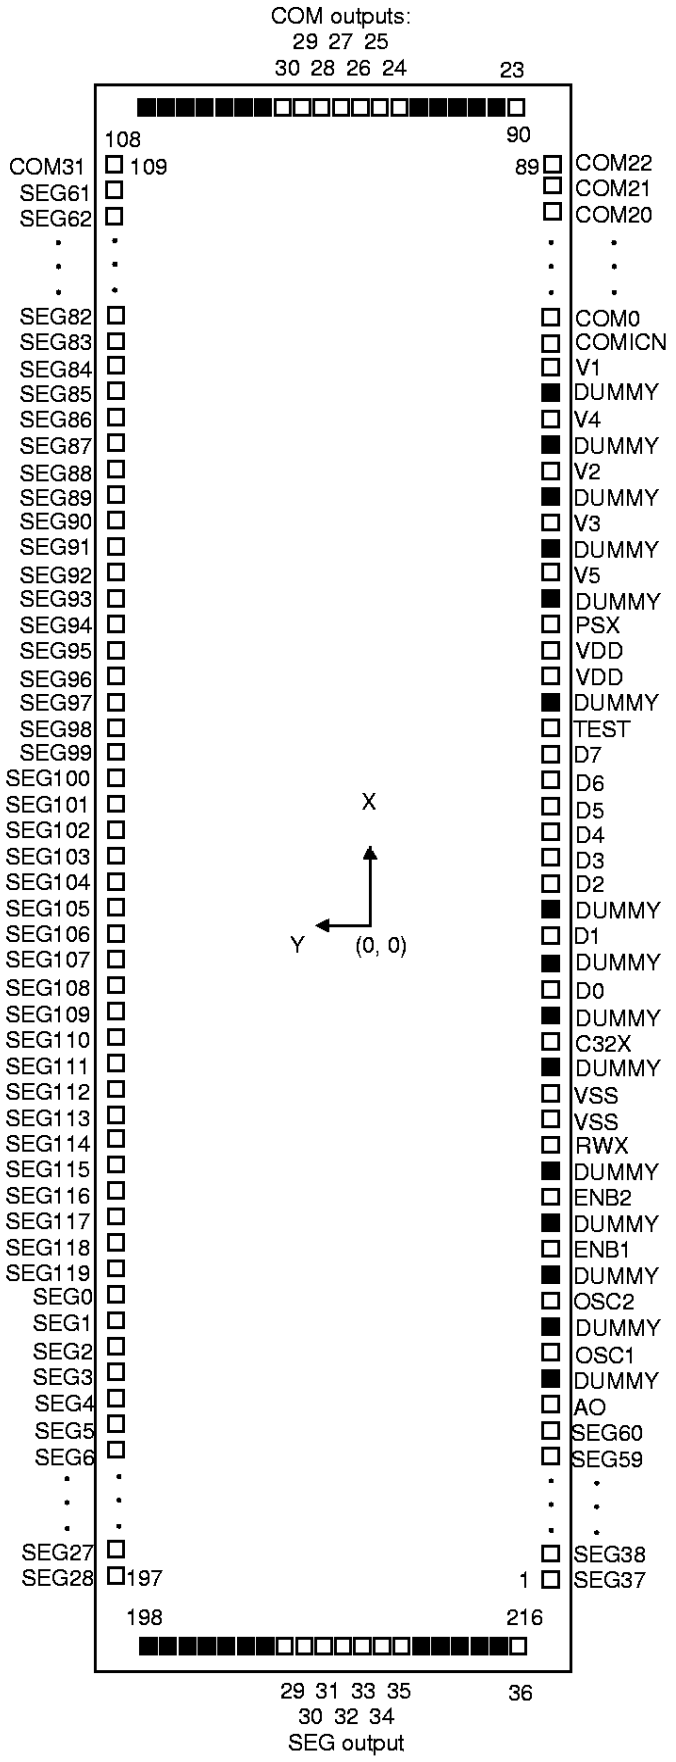
Pin No.	Pin name	Description
36, 37	V_{SS}	Power supply, negative
53, 54	V_{DD}	Power supply, positive
57, 59, 61, 64, 65	V_1 to V_5	Power supply pins for driving the liquid crystal. The voltage levels applied must be in the order shown below: $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$
25	A_0	Switching signal input between data display and control command display. Normally, the least significant bit of the address bus of MPU is connected. A_0="0" : D_0 to D_7 are provided for control command input and status output. A_0="1" : D_0 to D_7 are provided for displayed data I/O.
27	OSC_1	CR oscillator input. An oscillator resister R_f is connected. An external clock can be input.
29	OSC_2	CR oscillator output. An oscillator resister R_f is connected. When an external clock is input, the OSC_2 pin is open.
31	E1	Enable input pin 1. Enables displayed data RAM corresponding to SEG0 to SEG60 both for the parallel interface and serial interface. Active "L".
33	E2	Enable input pin 2. Enables displayed data RAM corresponding to SEG61 to SEG119 both for the parallel interface and serial interface. Active "L".
35	R/WX	Read/write signal input R/WX="H" : Read R/WX="L" : Write
	D_0 to D_7	P/SX : "H" 8-bit data bus connection tri-state I/O configuration P/SX : "L" serial interface connection D0 Serial data input D1 Clock input D2 Serial data input D3 to D7 Open
51	TEST	Test pin. This pin must be connected to V_{DD} because "Low" setting of this pin enters to test mode.
3	C3/2X	Duty selection. C3/2X="H" : 1/33 duty. Can be displayed by icon. C3/2X="L" : 1/32 duty
58	P/SX	Parallel interface/serial interface switching P/SX="H" : 8-bit interface P/SX="L" : Serial interface
	SEG_0 to SEG_{119}	Segment drive output
	COM_0 to COM_{31}	Common drive output. Output in the order COM_0 to COM_{31}.
66	COMICN	Common drive output for icon. Output when 1/33 duty is selected.
	DUMMY	Insulated from the inside of the IC.

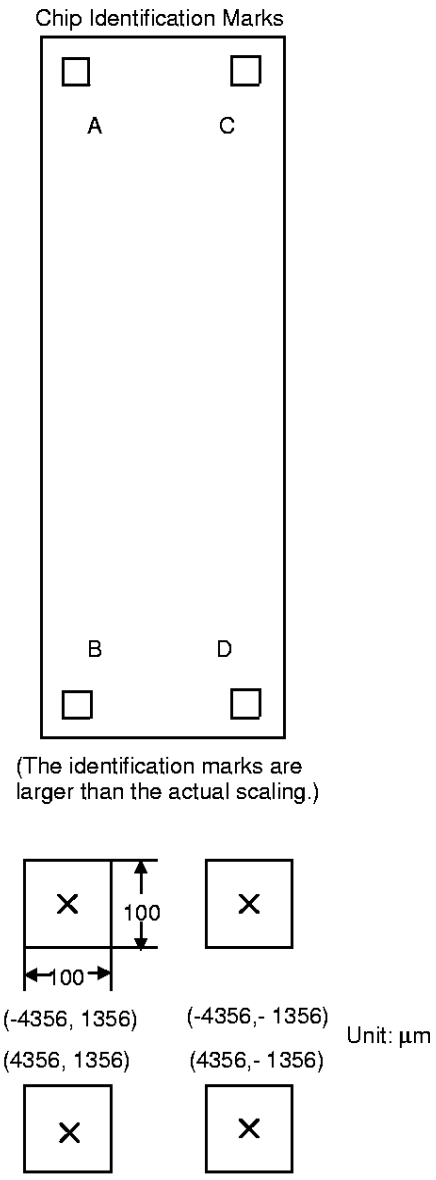
■ OPERATING FREQUENCY

Table 2 Operating Frequency

Operating Frequency	
Internal oscillation	External clock
18 kHz	18 kHz

■ PAD ASSIGNMENT





(The identification marks are larger than the actual scaling.)

- Chip size: 9.3×2.94 mm
- Pad pitch: 100 µm
- Gold bump size: 70× 110 µm
- Gold bump height: 22±7 µm
- Chip thickness: 400±30 µm

Note: Connect TEST pin to V_{DD}.

Figure 2 Pad Configuration

■ ABSOLUTE MAXIMUM RATINGS

Table 4 Absolute Maximum Ratings

Parameter	Symbol	Ratings	Unit
Supply voltage	V_{SS}	−6.0 to +0.4	V
LCD drive voltage 1	V_5	−13.5 to +0.4	V
LCD drive voltage 2	V_1, V_2, V_3, V_4	V_5 to +0.4	V
Input voltage	V_{IN}	V_{SS}−0.4 to +0.4	V
Output voltage	V_{OUT}	V_{SS}−0.4 to +0.4	V
Power dissipation	P_D	250	mW
Operating temperature	T_{opr}	−30 to +85	°C
Storage temperature	T_{stg}	−65 to +150	°C

Note 1: When a voltage over the absolute maximum rating is applied, the characteristics of the device may be drastically aggravated or the chip may be broken.
Note 2: It is recommended to use the device within the range of electrical characteristics. When it is used out of the range, the operations and the reliability of the device cannot be guaranteed.

■ DC CHARACTERISTICS

Table 5 DC Characteristics
(Unless otherwise specified : V_{DD}=0 V, V_{SS}=−5.0±0.5 V, Ta=−20 to 75 °C)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit	Note
Operating voltage	V_{SS}		−5.5	-	−2.4	V	Note 1, 2
Recommended operating voltage	V_{SS}		−5.5	−5.0	−4.5	V	Note 14
LCD drive voltage	V_5		−11.5	-	−2.7	V	Note 1, 2
	V_1, V_2		0.6×V_5	-	V_{DD}	V	
	V_3, V_4		V_5	-	0.4×V_5	V	
High level input voltage	V_{IHT}		V_{SS}+2.0	-	V_{DD}	V	Note 3, 13
	V_{IHC}		0.2×V_{SS}	-	V_{DD}	V	Note 4, 13
Low level input voltage	V_{ILT}		V_{SS}	-	V_{SS}+0.8	V	Note 3, 13
	V_{ILC}		V_{SS}	-	0.8×V_{SS}	V	Note 4, 13
High level output voltage	V_{OH1}	I_{OH}=-0.5 mA	V_{SS}+2.4	-	-	V	Note 5
	V_{OH2}	I_{OH}=-120 µA	0.2×V_{SS}	-	-	V	OSC_2
Low level output voltage	V_{OL1}	I_{OL}=0.5 mA	-	-	V_{SS}+0.4	V	Note 5
	V_{OL2}	I_{OL}=120 µA	-	-	0.8×V_{SS}	V	OSC_2
Input leakage current	I_{IL}		−1.0	-	1.0	µA	Note 6
Output leakage current	I_{OL}		−3.0	-	3.0	µA	Note 7
LCD driver ON resistance	R_{ON}	Ta=25°C V_5=−8.0 V	-	5.0	7.5	kΩ	SEG_0 to SEG_{119} COM_0 to COM_{31} Note 8
Standby current	I_S	CSX=CL=V_{DD}	-	0.05	1.0	µA	Note 9
Current consumption	I_{DD1}	During display, V_5=−5.0V R_f=1 MΩ	-	20.0	30.0	µA	Note 10
	I_{DD2}	During access, t_{CYC}=200 kHz	-	300	500	µA	Note 11
Oscillating frequency	f_{OSC}	R_f=1.0 MΩ, V_{SS}=−5.0 V	15	18	21	kHz	
		R_f=1.0 MΩ, V_{SS}=−3.0 V	11	16	21	kHz	
Wait time	t_w		1000	-	-	µs	Note 12

Note 1 $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$.
Note 2 Drastic fluctuation by power supply voltage, input signal voltage noise, etc. causes malfunction and normal operation can not be guaranteed. In any case, avoid intentionally changing the power supply voltage during operation.
Note 3 TTL input pins: A_0, D_0 to D_7, R/WX, E1, E2.
Note 4 CMOS input pins: C3/2X, P/SX
Note 5 D_0 to D_7
Note 6 Input pins: A_0, E1, E2, R/WX, OSC_1, C3/2X
Note 7 Input and output pins at high impedance: D_0 to D_7.
Note 8 This is the resistance when applying 0.1 V between the LCD drive output pins (SEG_0 to SEG_{119}, COM_0 to COM_{31}, COMICN) and the LCD drive power pins (V_1, V_2,V_3, and V_4 pins). R_{ON} is measured between the LCD drive power pins and the LCD drive output pins whose electric potential is the same as that of the LCD drive power pins.

Note 9 Current consumption when circuits, e.g. the oscillation circuit, the MPU interface, etc, are not operating.
Note 10 Current consumption by LCD panel and parasitic capacitance is not included.
Note 11 Current consumption when writing vertically-striped display data at t_{CYC}=200 kHz. After the termination of command, the current consumption value is I_{DD1}.
Note 12 Shows the wait time from when the power voltage rise to 80% of the specfied voltage to when the command input becomes available.
Note 13 Indicates the inversion level of input signal. The input signal must fully swing in the supply voltage range.
Note 14 When using a power supply voltage other than –5.0±0.5 V, the value is different. Check the power supply voltage.

D2 (SDO)	t_{DDS}	Data delay time	CL=15 pF		220	ns	
	t_{OHS1}	Data disable time 1	CL=15 pF	0	100	ns	Note 1
	t_{OHS2}	Data disable time 2	CL=15 pF	0	100	ns	Note 2

Note 1: D2(SDO) is uncertain when AO and R/WX change.

Note 2: D2(SDO) enters the high-impedance state at the positive edge of E1 and E2.

Important * The rise time and decay time of input signal is 15 nsec or less.

* The timing is stipulated by the 20% and 80% of signal waveform.

■ OPERATION

1. Power-on and off

1.1 Power-on

After power-on, set the default parameters through command input. Input the display off command immediately after the CPU starts. Set other parameters in order until the display starts. The C3/2X pin must be connected to V_{DD} or V_{SS} for use. The recommended procedures after power-on, are as follows:

1. Display ON/OFF
   D0: 0 Display OFF
2. Full display ON/OFF
   D0: 0 Full display OFF (start of oscilation)
3. End command input
4. ADC selection
5. Display start line
6. Page address "0000"
7. Column address "0000000"
8. Write display data *
9. Display ON
   D0: 1 Display ON (start of display)

* After power-on, write display data to all addresses of the display RAM before setting the display to ON because display RAM is not defined at start up.

1.2 Power-off

Power-off after setting display OFF through a CPU command. The recommended procedures at power-off are as follows:

1. Display ON/OFF
   D0: 0 Display OFF

Note: After power-on, the parameters except display data RAM are initialized by the operation of the internal reset circuit. The reset circuit operates at the positive edge of the power-on from ground voltage level. The operation of the reset circuit can not be guaranteed when the power does not rise from ground voltage level because of residual voltage from a momentary power failure or continuous power-on operations.

2. MPU Interface Select

In the S-4543A series, the 8-bit interface or serial interface can be selected.

Table 10 MPU Interface Select

P/SX pin logic	MPU interface
H	68-family interface
L	Serial interface

Note: The displayed data write instruction and displayed data read instruction cannot be executed with E1 and E2 active at the same time.

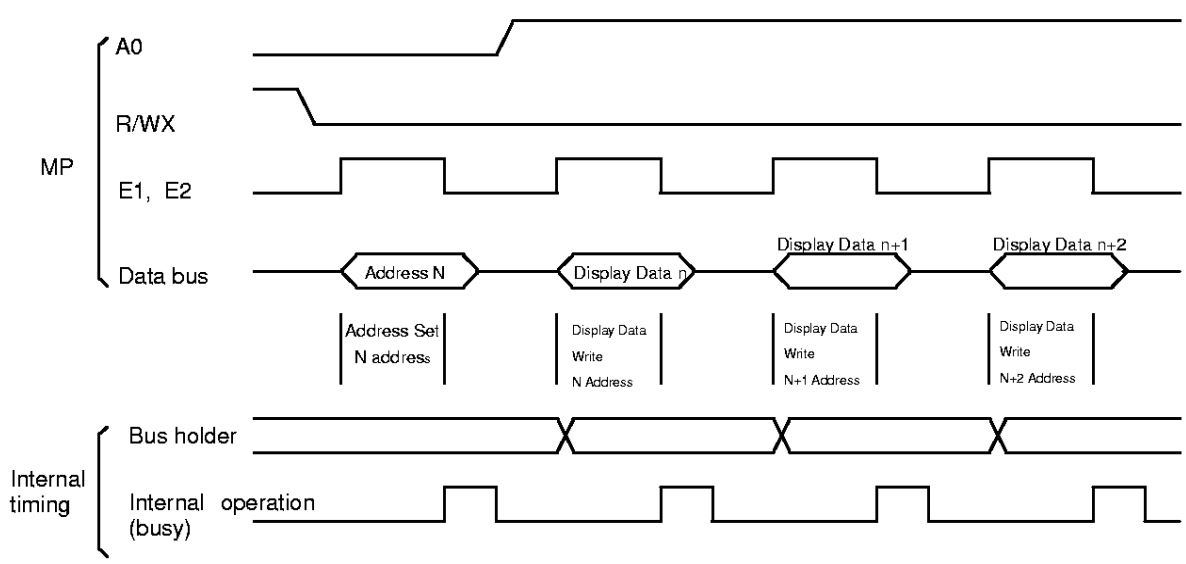
2.1 Parallel Interface

P/S : "H" Parallel Interface (Connected to VDD)
E1, E2 : Operation at the Falling Edge
R/WX : "L"WRITE Command, "H"READ Command
A0 : "L" Command Data, "H" Display Data
D0 to D7: Date Bus

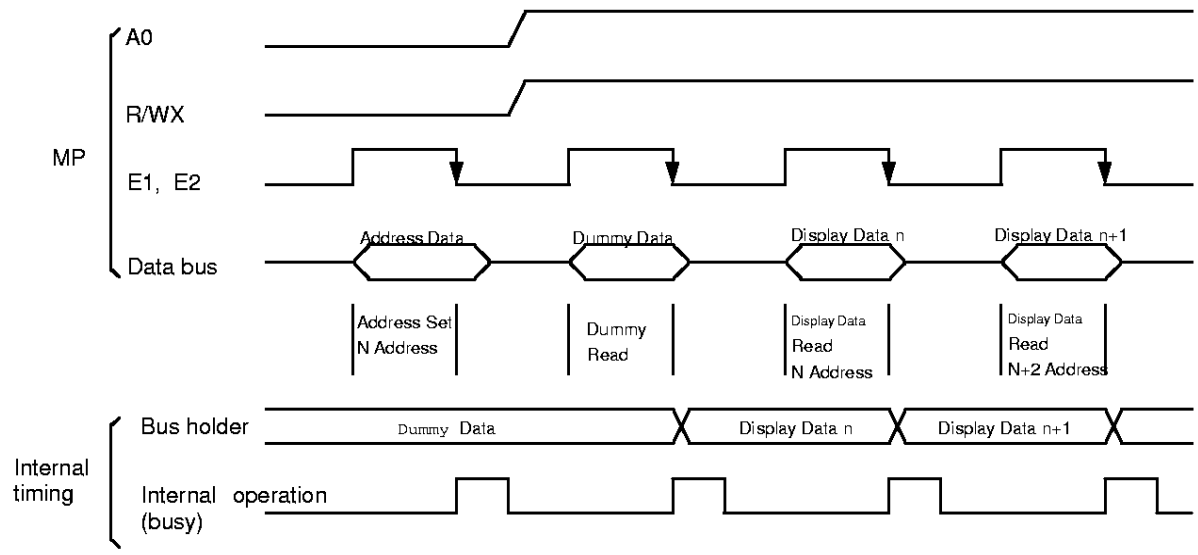
Note : When reading the command or display data, NEVER input a signal to E1 and E2 simultaneously.

Table 11 Pin Connection for MPU Interface

Names of Pins of the S4543A	A0	E1, E2	R / WX	D0 to D7
Names of Signals of 68 Family MPU	A0	E	R / $\overline{W}$	D0 to D7



Display Data Write



Display Data Read

Figure 5 Read/Write Timings of Parallel Interface Display Data

2.2 Serial Interface

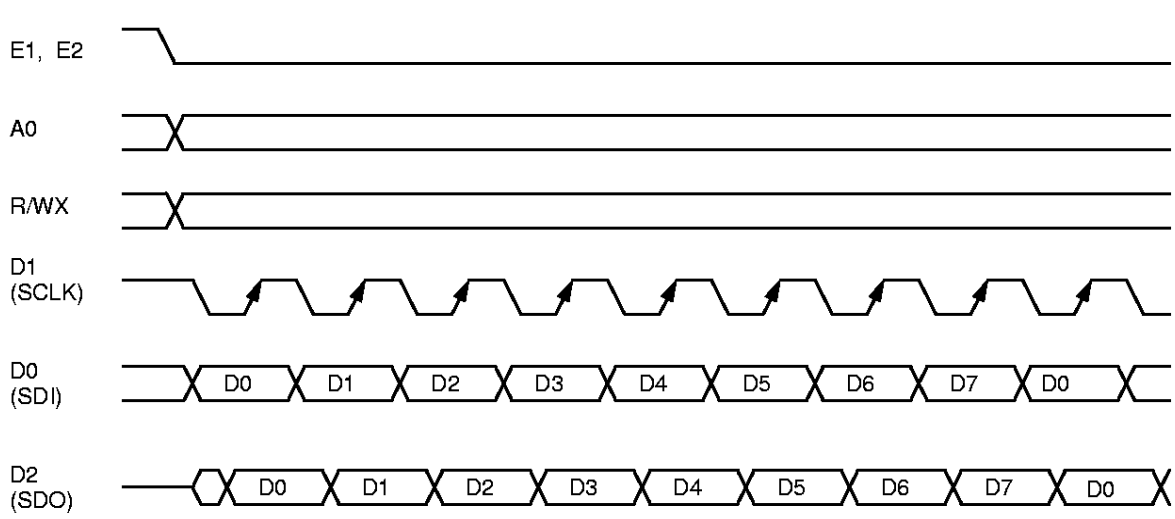
P / SX	:	Serial interface (Connected to VSS).	
E1, E2	:	"L" active.	"H" is reset.
R / WX	:	"L" write instruction.	"H" read instruction.
A0	:	"L" command data.	"H" displayed data.
D0	:	Serial data input pin (SDI)	
D1	:	Serial clock input pin (SCLK)	
D2	:	Serial data output pin (SDO)	
D3~D7	:	Open	

Note: The displayed data write instruction and read instruction cannot activate E1 and E2 at the same time.

By setting P/SX to "L", the serial interface is selected.
The instruction code is the same as for the parallel interface.
By setting E1, and E2 to "H", the serial interface circuit is reset and the counter is initialized. Either E1 or E2 is set to "L", the serial interface enters an operating state.
The commands and displayed data are written at the rising edge of serial clock. Data is input in the order D0 to D7 in 8-bit data. The status and displayed data are read at the falling edge of the serial clock.
Further, displayed data reading needs dummy reading.

A0	R / WX	Operation
L	L	Command input
H	H	Displayed data reading
L	H	Status reading
H	L	Displayed data writing

E1 and E2 cannot be set to "L" at the same time when displayed data is written or read out.
Status reading in a reset operation is invalidated at the time the serial interface is selected. However, "H" is output to the D2 pin (SD0: serial data output pin).
Serial clock wiring must be made by considering external noise and reflecting noise. Be sure to check the operation of the equipment.



A0	RWX	D0 (SDI)	D2 (SDO)
0	0	Command write	Status read
0	1	Invalid	Status read
1	0	Data write	Status read
1	1	Invalid	Data read (Note)

Note: Data reading needs dummy reading.

Figure 6 Read/Write Timings of Serial Interface Display Data

3. Status

The internal operation status of S-4543A is monitored for four kinds of status. The status is output in D_4 through D_7. For the monitoring method and function, refer to the Command functions section.
E1 and E2 cannot be activated at the same time during status reading.

Table 12 Internal Operation Status

Item	Output pin	Status	
Busy flag	D_7	"1": Command operation, Reset operation	"0": Command ready
ADC select	D_6	"1": Forward	"0": Reverse
Display ON/OFF	D_5	"1": Display all-lit	"0": Normal display status
Reset	D_4	"1": Resetting	"0": Normal operation status

4. Busy Flag

During internal operation, for example command operation, the busy flag is "1", and commands other than Status Read are not received. The Busy flag is output in D7 through the Status Read command. When accessing the S-4543A by the signal which specifies the value of read cycle and write cycle timing, the busy flag "0" is not required to be confirmed. Since busy flag check is not necessary, the load on MPU can be reduced.

5. Data Bus

Table 13 Data Bus

A_0	68 family R/WX	Operation
1	1	Read from Display Data RAM
1	0	Write to Display Data RAM
0	1	Status Read
0	0	Command Read to internal register

6. Display Data RAM

The S-4543A has Display Data RAM (8 bits X 4 pages X 122 columns + 120 columns for icon =4026 bits). It is possible to use the not-used area for display as normal SRAM. The Display Data RAM is in dual port RAM and enables access from the MPU through Page address and Column address. To the LCD driver side, the one line's common output is read by Line address. The correlation between Page address, Column address, and Line address is shown in Figure 7.
The displayed data RAM is made of dual-port RAM. The read/write access from the MPU interface is performed independently of the read access to the liquid display. The read/write access to displayed data from the MPU is done by a command. Data is read out to the liquid crystal display in synchronism with the liquid crystal display clock.
At the moment power is turned on, the contents of the displayed data RAM are uncertain. Following turning on power, clear the display RAM or write the displayed data with display OFF and then turn ON the display.
The displayed data RAM is divided into two parts by E1 and E2. The displayed data can be written into the column address corresponding to SEG0-SEG60 by E1. E2 enables data writing into the column address corresponding to SEG61-SEG119.

7. Reading and Writing of Display Data

The S-4543A reads and writes the display data through the internal bus holder. The display data is read to the bus holder from the display data RAM, and in the next read cycle on the data bus. Therefore, a dummy read cycle is needed before the first read cycle. When reading the display data after the address set and the data write cycle, a dummy read is needed. Since the reading of the display data is executed using this bus holder, it is possible to read the data at high speed.
Display data is written to the display data RAM through the bus holder within a write cycle. Therefore, writing the display data does not need a dummy cycle.
The displayed data is lit and unlit in the states "1" and "0", respectively.

8. Column Address

The column address of the Display Data RAM is used for reading/writing displayed data from/to the MPU. The column address is set by a command. When the displayed data RAM is accessed by the MPU, the address increments by one. When the most significant address of the column address is read/written, an invalid address is selected and it does not increment.

9. Page Address

The display RAM is composed of five pages. When accessing the display data RAM from MPU, the page of the display data RAM is set a command.

10. CR Oscillation Circuit

It incorporates a CR oscillator which generates the clock for display.
Oscillation frequency is approximately 18 kHz at R_f 1 MΩ.

11. LCD Driving Circuit

The S-4543A generates a liquid crystal drive waveform of 2-frame AC drive system (type B). See Figure 8, " Liquid Crystal Drive Output Waveform."

12. Display Timing Circuit

It generates the clock by the CR oscillator circuit or an external input for the timings of the liquid crystal drive. See Figure 8.
The frame frequency differs depending upon the selection of 1/32 or 1/33 duty ratio.

Table 15 Frame Frequency

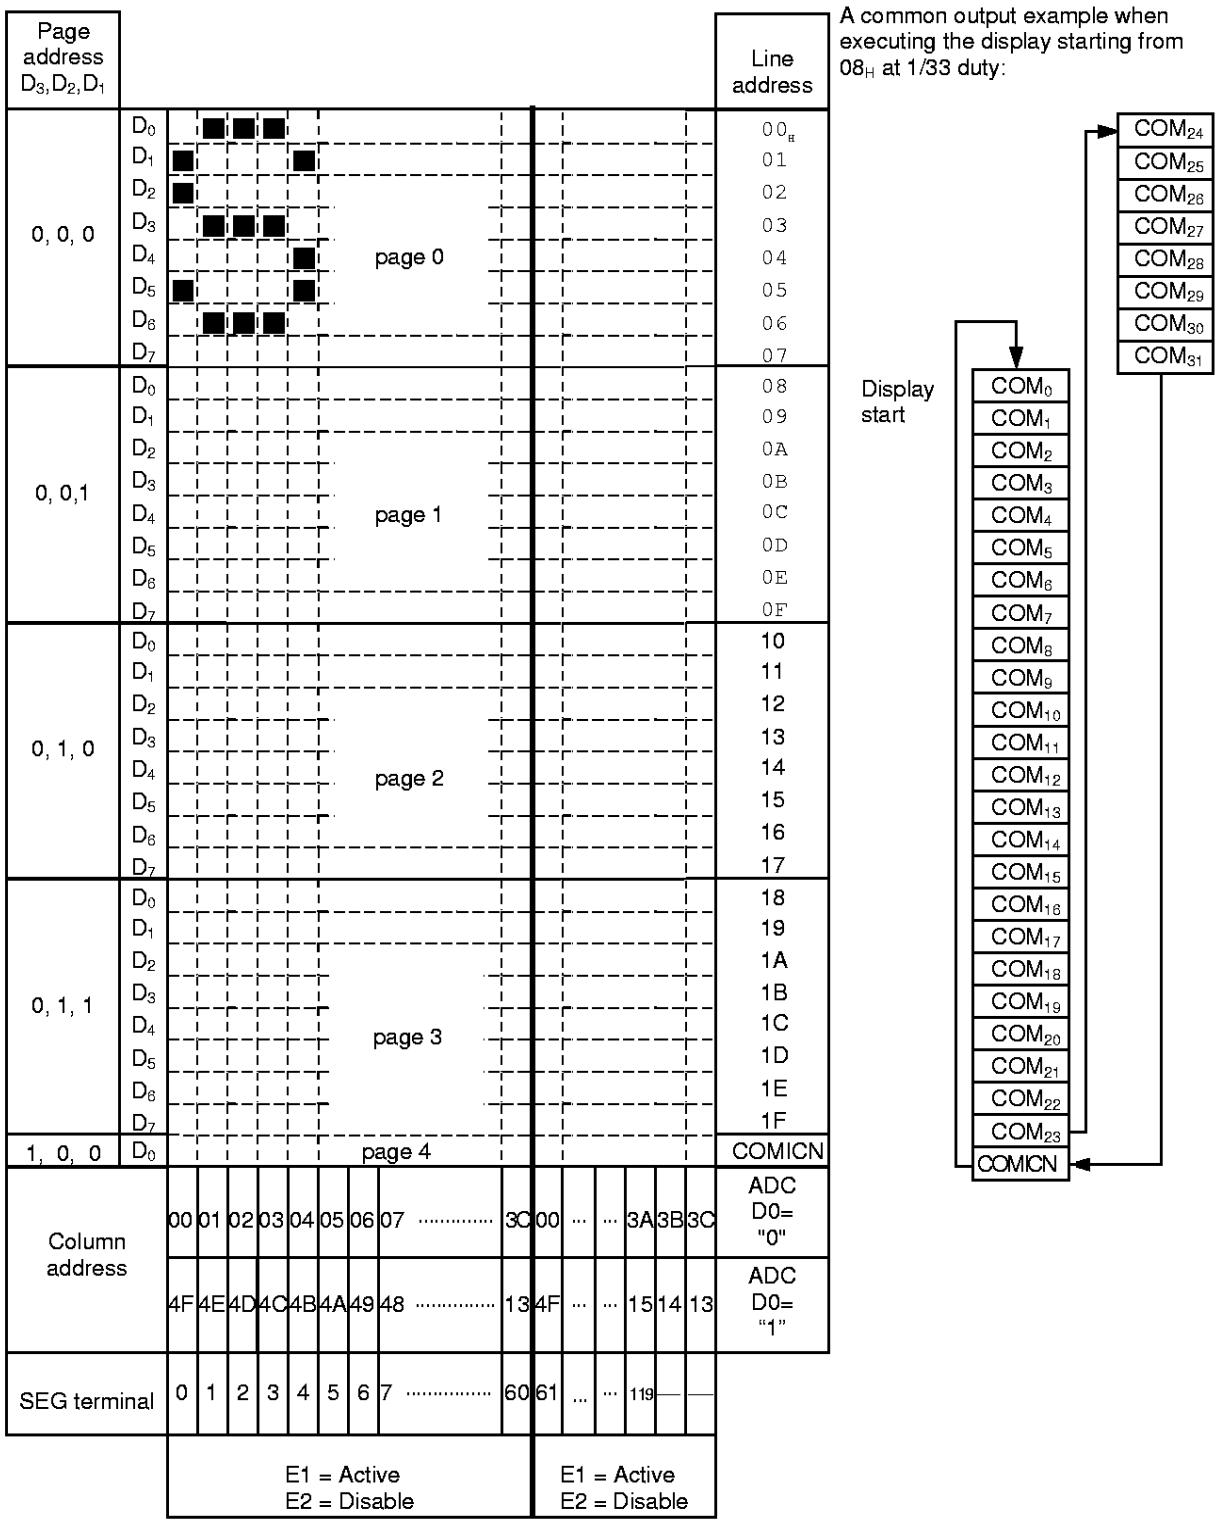
Duty	Frame Frequency f_{OSC}=18 kHz
1/32 duty	70.31 Hz
1/33 duty	68.18 Hz

13. Line Address

This is the address for reading the LCD RAM data to the LCD data latch. The line address is incremented synchronizing with the common output. Further, the display start line which is output to COM0 can be set by a command.

14. Display Data Latch

The display data latch is the circuit for latching one line's display data from the display RAM. The display data is output from this latch to the LCD drive circuit. Since the display ON/OFF and the display All-Lit ON/OFF control the display data latch, it has no effect on the display RAM data.



Note: For the display data RAM of the S-4543A Series, the memory area corresponding to SEG 0 through SEG119 is valid as display data. The other memory area can be used as normal SRAM.

Figure 7 Relationship between Display Data RAM and Addresses

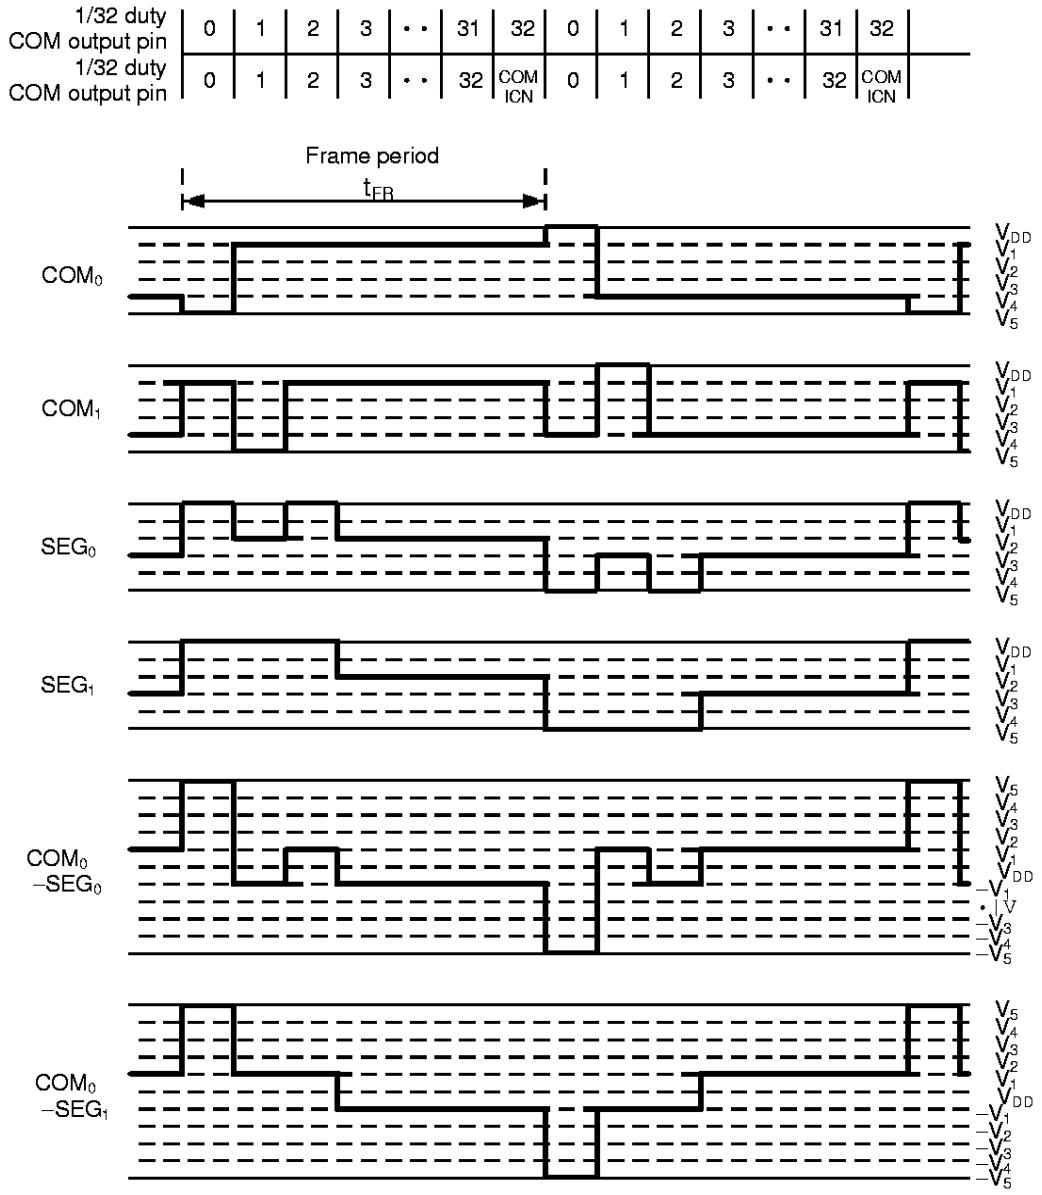


Figure 8 LCD Driver Waveform Example

Table 14 Frame Period

Display duty	Frame period
duty 1/32	256 / f_{OSC}
duty 1/33	264 / f_{OSC}

f_{osc}=CR oscillation frequency

■ COMMANDS

For S-4543A, the command functions can be set by the combination of A_0 and E1, and E2 and R/WX. The commands are set for S-4543A, by the internal timings different from the instructions of MPU. When displayed data writing in operational description, read-out timing chart, and timing characteristics chart are satisfied, the commands can be input without checking the busy flag. Therefore, high speed operation and MPU load reduction are attainable. For the command list, refer to Table 18.

1. Display ON/OFF

The logic D_0 controls the display ON/OFF. In display OFF, the screen is compelled to be all-off regardless of the display RAM data. The display RAM data does not change.
In display ON, normal display is on according to the display RAM data. When the display ON command is input, display OFF is canceled.
When setting display all-lit ON in the display OFF status, it changes to Power save mode (see the Power Save command.)

2. Display Start Line Set

The line address of the display data RAM which indicates the display start line is set. The display start line corresponding to COM_0, as shown in the figure, indicates the correlation between the display data RAM and the address. The display area read from the display data RAM corresponds to the number of the lines for the duty set using the Duty select command. The line address is automatically incremented synchronizing with the common output. Changing the display START line using this command enables a smooth scroll on the screen or a page change .

3. Page Address Set

The page address is set when accessing the display data RAM from the MPU. It is possible to access the display data RAM from the MPU using the page address and the column address. Refer to the figure 7 which shows the correlation between the display data RAM and the address. Even if the page address is changed, it has no influence, such as changing of the screen during operation.

4. Column Address Set

The column address is set when accessing the display data RAM from the MPU. When accessing the display data RAM from the MPU, the column address is incremented by one. When accessing the successive column address from the MPU, it is possible to access the display data without setting the column address each time. The automatic increment stops after the uppermost column address is accessed.
When selecting “Reverse” using the “ADC select” command, the lowermost column address is 13H; the uppermost column address is 4FH.

5. Status Read

It is possible to read four kinds of status using this command.

Table 15 Status Read

Busy	Shows the command ready during the S-4543A command operation. "1" : Shows that the IC inside is executing a command operation or a reset operation. When the Busy flag is output, the command is not received. If the cycle time of the command is satisfied with the specified value, Busy flag confirmation is not needed. "0" : Shows that the command is ready
ADC	Shows forward or reverse correlation between column address and segment output terminal of the display data RAM The setting is executed using the ADC select command. "1" : Forward The correspondence between the column addresses and segment output pins are such that: [1] The column addresses 0_H to $3C_H$ into which data is written at the time E1=active correspond to the segment outputs 0 to 60. [2] The column addresses 0_H to $3A_H$ into which data is written at the time E2=active correspond to the segment outputs 61 to 119. "0" : Reverse The correspondence between the column addresses and segment output pins are such that: [1] The column addresses 13_H to $4F_H$ into which data is written at the time E1=active correspond to the segment outputs 60 to 0. [2] The column addresses 15_H-$4F_H$ into which data is written at the time E2=active correspond to the segment outputs 119 to 61.
ON/OFF	Shows the display ON/OFF status. Note: it is the reverse to the polarity of Display ON/OFF command. "0" : Shows the display ON status. Display normal operation status "1" : Shows the display OFF status. Display all-OFF status.
Reset	Shows that the S-4543A is executing initialization by RESX input or Reset command. "0" : Normal operation "1" : Reset operation

6. Write Data

The 8-bit display data is written in the display data RAM. After writing the display data, the column address is automatically incremented. When writing the successive display data after setting the first column address using the column address set command, it is unnecessary to set the column address each time.
For the serial interface, the displayed data is written in the unit of 8 bits.

7. Read Data

The 8-bit display data is read from the display data RAM. After reading the display data, the column address is automatically incremented. When reading the successive display data after setting the first column address using the column address set command, it is unnecessary to set the column address each time. For reading display data just after the column address set, a dummy read is needed.
The serial interface also needs dummy reading.

8. ADC Select

Forward or reverse can be selected for the correlation between the column address and the segment output terminal of the display data RAM. Make sure the RAM corresponds to the address.

D0 D0 : "0" Forward: The column addresses 0_H to $3C_H$, which are written when E1 is"H," correspond to the segment output terminals starting from 0 to 60; the column addresses 0_H to $3A_H$, which are written when E2 is "H,"correspond to the segment output terminals starting from 61 to 119.

D0 : "1" Reverse: The column addresses 13_H to $4F_H$, which are written when E1 is "H," correspond to the segment output terminals starting from 60 to 0; the column addresses 15_H to $4F_H$, which are written when E2 is "H,"correspond to the segment output terminals starting from 119 to 61.

9. Display All-Lit ON/OFF

Display all-lit ON makes the display be entirely lit. All common outputs become selectable status. Segment output is compelled to be all-lit output. The display RAM•fs data, however does not change.
Through Display all-lit OFF, the screen returns to normal display operation.
When inputting the Display OFF command in the display all-lit ON status, it changes to Power save mode (Refer to the Power save command).

10. Read Modify Write

The read modify write command is valid when partly altering or rewriting the display data RAM, for example the cursor indication, the blinking indication, etc. After inputting the Read modify write command, column address of the display data RAM is incremented only when inputting the display data write command. In Read data command, it is possible to rewrite the display data of the column address which is read, without increment of the column address. Furthermore, when reading and writing of the display data is successively executed, the successive address of the display data RAM is rewritten within the same page. A dummy read is needed when reading the display data.
Read modify write command is valid until the End command is input. When inputting the End command, the column address returns to the address before the Read modify command was input.
During the Read modify write command operation, all commands are usable except the Column address set command.

11. End Command

This command cancels Read modify write. The column address of the display data returns to the address prior to execution of the Read Modify Write command.

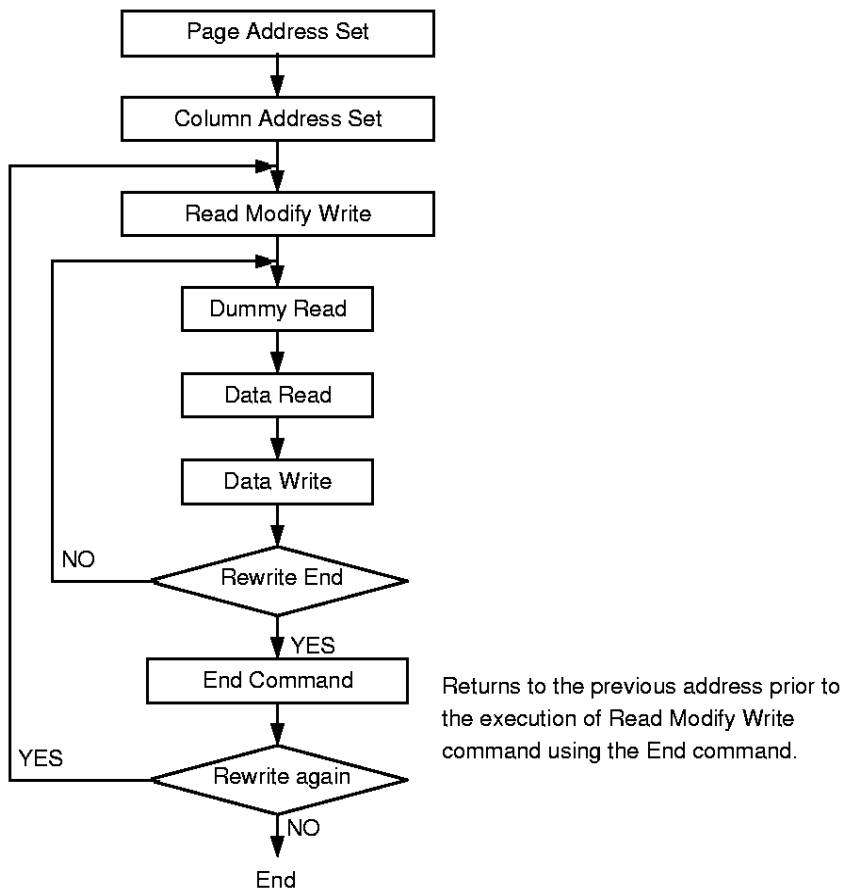

Figure 9 Command Sequence for Cursor Indication

12. Reset Command

This command resets the address of the display data RAM as follows:
After resetting, display starts according to the reset value.

- Resets the Display START Line to the 1st line.
- Resets the page address to 3.

13. Power Save Mode

When setting display all-OFF using the Display OFF command and executing the Display all-lit ON command, it changes to the Power save mode. When displaying in all-lit status and executing the Display OFF command, it also changes to the Power save mode. In the Power save mode,

- Current consumption is reduced and a value near that at standstill is attainable.
- The LCD drive circuit is stopped. The Segment and Common outputs are fixed at V_{DD} level.
- nput is prohibited and the OSC_2 terminal floats.
- Content of the display data RAM, the command and the address before the power save mode do not change.

The Power save status is canceled through the Display ON or the Display all-lit commands.
When the LCD driver voltage is generated by division of external resistance, the electric current is passed through this divided resistance regardless of the ICs. When reducing this current, attach a switching transistor which cuts the current flowing to the external resistance.

Table 16 Power Save Commands

Command Combination		Status
Display	Display All-Lit	
ON	OFF	Normal display operation
ON	ON	All-lit display
OFF	OFF	All-off
OFF	ON	Power save

Notes on command input:

The displayed data RAM reading/writing and status reading are done by activating E1 and E2 independently of each other.
The commands for inputting data into the liquid crystal display are enabled by activating either E1 or E2.

Table 17 Command Input

	Instructions which can be executed and in which commands can be input with E1 and E2 active at the same time	Commands corresponding to SEG0-SEG60 and SEG61-119 with E1 or E2 active	Instructions which can be executed and in which commands can be input with either E1 or E2 is made active
Display ON/OFF	O		O

Table 20 Display Commands

Command	Code										Description	
	A_0	R/W X WRX	D_7	D_6	D_5	D_4	D_3	D_2	D_1	D_0		
Display ON/OFF	0	0	1	0	1	0	1	1	1	0 / 1	Selects normal display or all off on the screen. D_0 : 1ON. Normal display operation using the display data RAM. D_0 : 0OFF. Display OFF status regardless of the display RAM data. Power Save mode is entered by display OFF and display all-lit ON.	
Display START Line	0	0	1	1	0	Display start line address (See Table 21)					Sets the line address of the display data RAM to be displayed at the top line of the screen (COM_0 output). Address setting ranges from 0 to 31.	
Page Address Set	0	0	1	0	1	1	1	Page address (See Table 20)			Sets up the page address of the display data RAM in order to access the display data RAM from the MPU. Address setting ranges from 0 to 4.	
Column Address Set	0	0	0	Column address (See Table 21)							Sets up the column address of the display data RAM in order to access the display data RAM from the MPU. Address setting ranges from 0 to 79.	
Status Read	0	1	Busy	ADC	Display ON/ OFF	Reset	0	0	0	0	Reads the status. BUSY 1: Command operation 0: Command ready ADC 1: Column address forward 0: Column address invert Display ON/OFF 1: Display all-off status 0: Normal display status RESET 1: Resetting 0: Normal operation	
Write Display Data	1	0	Data written into the displayed data RAM								Writes the data D_0 through D_7 on the display data RAM.	Sets the display RAM's address using Page Address Set and Column Address Set. When accessing the display data RAM, the column address is automatically incremented.
Read Display Data	1	1	Data read from the displayed data RAM								Reads the data D_0 through D_7 from the display data RAM.	
ADC Select	0	0	1	0	1	0	0	0	0	0 / 1	Used to invert the column address of the display data RAM, after which the correlation between the display RAM's addresses and segment output terminals is inverted. D_0 : 0 Forward D_0 : 1 Reverse	
Display all-lit ON/OFF	0	0	1	0	1	0	0	1	0	0 / 1	Selects normal display operation or all-lit display operation. D_0 : 0 Normal display operation D_0 : 1 All-lit display operation The screen is changed to all-lit status. Power Save mode is entered through display OFF and display all-lit ON.	
Read Modify Write	0	0	1	1	1	0	0	0	0	0	Increments the column address of display data RAM only when display data is written but not when it is read.	
End	0	0	1	1	1	0	1	1	1	0	Cancels Read Modify Write mode and increments the column address of the display data RAM when display data is written and read.	
Reset	0	0	1	1	1	0	0	0	1	0	Resets the address of the display data RAM as follows: • Resets the Display START Line to the 1st line. • Resets the page address to 3.	

Table 21 Display Start Line Address
