

MOS INTEGRATED CIRCUIT

μ PD4264405, 42S65405, 4265405

64 M-BIT DYNAMIC RAM 16 M-WORD BY 4-BIT, EDO

Description

The μ PD4264405, 42S65405, 4265405 are 16,777,216 words by 4 bits CMOS dynamic RAMs with optional EDO.

EDO is a kind of the page mode and is useful for the read operation.

Besides, the μ PD42S65405 can execute $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh.

These are packaged in 32-pin plastic TSOP (II) and 32-pin plastic SOJ.

Features

- EDO (Hyper page mode)
- 16,777,216 words by 4 bits organization
- Single +3.3 V $\pm$ 0.3 V power supply
- Fast access and cycle time

★

Part number	Power consumption Active (MAX.)	Access time (MAX.)	R/W cycle time (MIN.)	EDO (Hyper page mode) cycle time (MIN.)
μ PD4264405-A50	360 mW	50 ns	84 ns	20 ns
μ PD42S65405-A50, 4265405-A50	468 mW			
μ PD4264405-A60	324 mW	60 ns	104 ns	25 ns
μ PD42S65405-A60, 4265405-A60	396 mW			

★

- The μ PD42S65405 can execute $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh.

Part number	Refresh cycle	Refresh	Power consumption at standby (MAX.)
μ PD42S65405	4,096 cycles/128 ms	$\overline{\text{RAS}}$ only refresh, Normal read/write, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh, Hidden refresh	0.72 mW (CMOS level input)
μ PD4264405	8,192 cycles/64 ms	$\overline{\text{RAS}}$ only refresh, Normal read/write	1.8 mW (CMOS level input)
	4,096 cycles/64 ms	$\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh, Hidden refresh	
μ PD4265405	4,096 cycles/64 ms	$\overline{\text{RAS}}$ only refresh, Normal read/write, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh, Hidden refresh

Input/Output Pin Functions

The μ PD4264405, 42S65405, 4265405 have input pins $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, $\overline{\text{OE}}$, Address^{Note} and input/output pins I/O1 to I/O4.

Pin name	Input/Output	Function
$\overline{\text{RAS}}$ (Row address strobe)	Input	$\overline{\text{RAS}}$ activates the sense amplifier by latching a row address and selecting a corresponding word line. It refreshes memory cell array of one line selected by the row address. It also selects the following function. • $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh
$\overline{\text{CAS}}$ (Column address strobe)	Input	$\overline{\text{CAS}}$ activates data input/output circuit by latching column address and selecting a digit line connected with the sense amplifier.
A0 to A _X ^{Note} (Address inputs)	Input	Address bus. Input total 24-bit of address signal, upper bits and lower bits ^{Note} in sequence (address multiplex method). Therefore, one word is selected from 16,777,216-word by 4-bit memory cell array. In actual operation, latch row address by specifying row address and activating $\overline{\text{RAS}}$. Then, switch the address bus to column address and activate $\overline{\text{CAS}}$. Each address is taken into the device when $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are activated. Therefore, the address input setup time (t_{ASR} , t_{ASC}) and hold time (t_{RAH} , t_{CAH}) are specified for the activation of $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$.
$\overline{\text{WE}}$ (Write enable)	Input	Write control signal. Write operation is executed by activating $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$.
$\overline{\text{OE}}$ (Output enable)	Input	Read control signal. Read operation can be executed by activating $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{OE}}$. If $\overline{\text{WE}}$ is activated during read operation, $\overline{\text{OE}}$ is to be ineffective in the device. Therefore, read operation cannot be executed.
I/O1 to I/O4 (Data inputs/outputs)	Input/Output	4-bit data bus. I/O1 to I/O4 are used to input/output data.

Note

Part number	Address inputs	Upper bits	Lower bits
μ PD4264405	A0 - A12	13	11
μ PD42S65405, 4265405	A0 - A11	12	12

Hyper Page Mode (EDO)

The hyper page mode (EDO) is a kind of page mode with enhanced features. The two major features of the hyper page mode (EDO) are as follows.

1. Data output time is extended.

In the hyper page mode (EDO), the output data is held to the next $\overline{\text{CAS}}$ cycle's falling edge, instead of the rising edge. For this reason, valid data output time in the hyper page mode (EDO) is extended compared with the fast page mode (= data extend function). In the fast page mode, the data output time becomes shorter as the $\overline{\text{CAS}}$ cycle time becomes shorter. Therefore, in the hyper page mode (EDO), the timing margin in read cycle is larger than that of the fast page mode even if the $\overline{\text{CAS}}$ cycle time becomes shorter.

2. The $\overline{\text{CAS}}$ cycle time in the hyper page mode (EDO) is shorter than that in the fast page mode.

In the hyper page mode (EDO), due to the data extend function, the $\overline{\text{CAS}}$ cycle time can be shorter than in the fast page mode if the timing margin is the same.

Taking a device whose t_{RAC} is 60 ns as an example, the $\overline{\text{CAS}}$ cycle time in the fast page mode is 25 ns while that in the fast page mode is 40 ns.

In the hyper page mode (EDO) , read (data out) and write (data in) cycles can be executed repeatedly during one $\overline{\text{RAS}}$ cycle. The hyper page mode (EDO) allows both read and write operations during one cycle.

The following shows a part of the hyper page mode (EDO) read cycle. Specifications to be observed are described in the next page.

Hyper Page Mode (EDO) Read Cycle

Cautions when using the hyper page mode (EDO)

1. $\overline{\text{CAS}}$ access should be used to operate t_{HPC} at the MIN. value.
2. To make I/Os to Hi-Z in read cycle, it is necessary to control $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, $\overline{\text{OE}}$ as follows. The effective specification depends on the state of each signal.
 - (1) Both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are inactive (at the end of read cycle)

$\overline{\text{WE}}$: inactive, $\overline{\text{OE}}$: active

t_{OFC} is effective when $\overline{\text{RAS}}$ is inactivated before $\overline{\text{CAS}}$ is inactivated.

t_{OFR} is effective when $\overline{\text{CAS}}$ is inactivated before $\overline{\text{RAS}}$ is inactivated.

The slower of t_{OFC} and t_{OFR} becomes effective.
 - (2) Both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are active or either $\overline{\text{RAS}}$ or $\overline{\text{CAS}}$ is active (in read cycle)

$\overline{\text{WE}}$, $\overline{\text{OE}}$: inactive t_{OEZ} is effective.

Both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are inactive or $\overline{\text{RAS}}$ is active and $\overline{\text{CAS}}$ is inactive (at the end of read cycle)

$\overline{\text{WE}}$, $\overline{\text{OE}}$: active and either t_{RRH} or t_{RCH} must be met t_{WEZ} and t_{WPZ} are effective.

The faster of t_{OEZ} and t_{WEZ} becomes effective.

The faster of (1) and (2) becomes effective.
3. In read cycle, the effective specification depends on the state of $\overline{\text{CAS}}$ signal when controlling data output with the $\overline{\text{OE}}$ signal.
 - (1) $\overline{\text{CAS}}$: inactive, $\overline{\text{OE}}$: active t_{CHO} is effective.
 - (2) $\overline{\text{CAS}}$, $\overline{\text{OE}}$: active t_{CH} is effective.

Electrical Specifications

- All voltages are referenced to GND.
- After power up ($V_{CC} \geq V_{CC(MIN.)}$), wait more than 100 μs ($\overline{RAS}$, $\overline{CAS}$ inactive) and then, execute eight $\overline{CAS}$ before $\overline{RAS}$ or $\overline{RAS}$ only refresh cycles as dummy cycles to initialize internal circuit.

Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Voltage on any pin relative to GND	V_T		-0.5 to +4.6	V
Supply voltage	V_{CC}		-0.5 to +4.6	V
Output current	I_O		50	mA
Power dissipation	P_D		1	W
Operating ambient temperature	T_A		0 to +70	$^{\circ}C$
Storage temperature	T_{stg}		-55 to +125	$^{\circ}C$

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply voltage	V_{CC}		3.0	3.3	3.6	V
High level input voltage	V_{IH}		2.0		$V_{CC} + 0.3$	V
Low level input voltage	V_{IL}		-0.3		+0.8	V
Operating ambient temperature	T_A		0		70	$^{\circ}C$

Capacitance ($T_A = 25^{\circ}C$, $f = 1$ MHz)

Parameter	Symbol	Test condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{I1}	Address			5	pF
	C_{I2}	$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$			7	
Data input/output capacitance	$C_{I/O}$	I/O			7	pF

- Notes**
1. I_{CC1}, I_{CC3}, I_{CC4}, I_{CC5} and I_{CC6} depend on cycle rates (t_{RC} and t_{HPC}).
 2. Specified values are obtained with outputs unloaded.
 3. I_{CC1} and I_{CC3} are measured assuming that address can be changed once or less during $\overline{\text{RAS}} \leq V_{\text{IL}}(\text{MAX.})$ and $\overline{\text{CAS}} \geq V_{\text{IH}}(\text{MIN.})$.
 4. I_{CC3} is measured assuming that all column address inputs are held at either high or low.
 5. I_{CC4} is measured assuming that all column address inputs are switched only once during each hyper page (EDO) cycle.

Transition time (rise and fall)		t _T	1	50	1	50	ns	
Refresh time	μPD42S65405	t _{REF}	–	128	–	128	ms	4
	μPD4264405, 4265405		–	64	–	64	ms	

- Notes** 1. In $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles, $t_{\text{RAS}}(\text{MAX})$ is 100 μs .
 If 10 μs < t_{RAS} < 100 μs , $\overline{\text{RAS}}$ precharge time for $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh (t_{RPS}) is applied.
2. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{\text{RAS}}$
$t_{\text{RAD}} \leq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$	$t_{\text{RAC}}(\text{MAX.})$	$t_{\text{RAC}}(\text{MAX.})$
$t_{\text{RAD}} > t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$	$t_{\text{AA}}(\text{MAX.})$	$t_{\text{RAD}} + t_{\text{AA}}(\text{MAX.})$
$t_{\text{RCD}} > t_{\text{RCD}}(\text{MAX.})$	$t_{\text{CAC}}(\text{MAX.})$	$t_{\text{RCD}} + t_{\text{CAC}}(\text{MAX.})$

$t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}}(\text{MAX.})$ are specified as reference points only ; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC} , t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{MAX.})$ will not cause any operation problems.

3. $t_{\text{CRP}}(\text{MIN.})$ requirement is applied to $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ cycles.
4. This specification is applied only to the $\mu\text{PD42S65405}$.

Read Cycle

Parameter	Symbol	$t_{\text{RAC}} = 50 \text{ ns}$		$t_{\text{RAC}} = 60 \text{ ns}$		Unit	Notes

$\overline{\text{CAS}}$ hold time to $\overline{\text{OE}}$	t_{CHO}	5	—	5	—	ns	4

- Notes** 1. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{\text{RAS}}$
$t_{\text{RAD}} \leq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$	$t_{\text{RAC}}(\text{MAX.})$	$t_{\text{RAC}}(\text{MAX.})$
$t_{\text{RAD}} > t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$	$t_{\text{AA}}(\text{MAX.})$	$t_{\text{RAD}} + t_{\text{AA}}(\text{MAX.})$
$t_{\text{RCD}} > t_{\text{RCD}}(\text{MAX.})$	$t_{\text{CAC}}(\text{MAX.})$	$t_{\text{RCD}} + t_{\text{CAC}}(\text{MAX.})$

$t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}}(\text{MAX.})$ are specified as reference points only ; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC} , t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{MAX.})$ will not cause any operation problems.

2. Either $t_{\text{RCH}}(\text{MIN.})$ or $t_{\text{RRH}}(\text{MIN.})$ should be met in read cycles.
3. $t_{\text{OEZ}}(\text{MAX.})$ defines the time when the output achieves the condition of Hi-Z and is not referenced to V_{OH} or V_{OL} .
4. $\overline{\text{WE}}$: inactive (in read cycle)
 $\overline{\text{CAS}}$: inactive, $\overline{\text{OE}}$: active ... t_{CHO} is effective.
 $\overline{\text{CAS}}$, $\overline{\text{OE}}$: active ... t_{OCH} is effective.

Write Cycle

Parameter	Symbol	t _{RAC} = 50 ns		t _{RAC} = 60 ns		Unit	Notes
		MIN.	MAX.	MIN.	MAX.		
$\overline{\text{WE}}$ hold time referenced to $\overline{\text{CAS}}$	t _{WCH}	7	—	10	—	ns	1
$\overline{\text{WE}}$ pulse width	t _{WP}	7	—	10	—	ns	1
$\overline{\text{WE}}$ lead time referenced to $\overline{\text{RAS}}$	t _{RWL}	13	—	15	—	ns	
$\overline{\text{WE}}$ lead time referenced to $\overline{\text{CAS}}$	t _{CWL}	7	—	10	—	ns	
$\overline{\text{WE}}$ setup time	t _{WCS}	0	—	0	—	ns	2
$\overline{\text{OE}}$ hold time	t _{OEH}	0	—	0	—	ns	
Data-in setup time	t _{DS}	0	—	0	—	ns	3
Data-in hold time	t _{DH}	7	—	10	—	ns	3

- Notes**
1. t_{WP} (MIN.) is applied to late write cycles or read modify write cycles. In early write cycles, t_{WCH} (MIN.) should be met.
 2. If t_{WCS} ≥ t_{WCS} (MIN.), the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle.
 3. t_{DS} (MIN.) and t_{DH} (MIN.) are referenced to the $\overline{\text{CAS}}$ falling edge in early write cycles. In late write cycles and read modify write cycles, they are referenced to the $\overline{\text{WE}}$ falling edge.

Read Modify Write Cycle

Parameter	Symbol	t _{RAC} = 50 ns		t _{RAC} = 60 ns		Unit	Note
		MIN.	MAX.	MIN.	MAX.		
Read modify write cycle time	t _{RWC}	107	—	133	—	ns	
$\overline{\text{RAS}}$ to $\overline{\text{WE}}$ delay time	t _{RWD}	64	—	77	—	ns	1
$\overline{\text{CAS}}$ to $\overline{\text{WE}}$ delay time	t _{CWD}	27	—	32	—	ns	1
Column address to $\overline{\text{WE}}$ delay time	t _{AWD}	39	—	47	—	ns	1

- Note**
1. If t_{WCS} ≥ t_{WCS} (MIN.), the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If t_{RWD} ≥ t_{RWD} (MIN.), t_{CWD} ≥ t_{CWD} (MIN.), t_{AWD} ≥ t_{AWD} (MIN.) and t_{CPWD} ≥ t_{CPWD} (MIN.), the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.

Hyper Page Mode (EDO)

Parameter	Symbol	$t_{RAC} = 50 \text{ ns}$		$t_{RAC} = 60 \text{ ns}$		Unit	Notes
		MIN.	MAX.	MIN.	MAX.		
Read / Write cycle time	t_{HPC}	20	—	25	—	ns	1
$\overline{RAS}$ pulse width	t_{RASP}	50	125,000	60	125,000	ns	
$\overline{CAS}$ pulse width	t_{HCAS}	8	10,000	10	10,000	ns	
$\overline{CAS}$ precharge time	t_{CP}	7	—	10	—	ns	
Access time from $\overline{CAS}$ precharge	t_{ACP}	—	30	—	35	ns	
$\overline{CAS}$ precharge to $\overline{WE}$ delay time	t_{CPWD}	41	—	52	—	ns	2
$\overline{RAS}$ hold time from $\overline{CAS}$ precharge	t_{RHCP}	30	—	35	—	ns	
Read modify write cycle time	t_{HPRWC}	52	—	66	—	ns	
Data output hold time	t_{DHC}	5	—	5	—	ns	
$\overline{OE}$ to $\overline{CAS}$ hold time	t_{OCH}	5	—	5	—	ns	3
$\overline{OE}$ precharge time	t_{OEP}	5	—	5	—	ns	
Output buffer turn-off delay from $\overline{WE}$	t_{WEZ}	0	10	0	13	ns	4,5
$\overline{WE}$ pulse width	t_{WPZ}	7	—	10	—	ns	5
Output buffer turn-off delay from $\overline{RAS}$	t_{OFR}	0	10	0	13	ns	4,5
Output buffer turn-off delay from $\overline{CAS}$	t_{OFC}	0	10	0	13	ns	4,5

Notes 1. t_{HPC} (MIN.) is applied to $\overline{CAS}$ access.

2. If $twcs \geq twcs(\text{MIN.})$, the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If $trwd \geq trwd(\text{MIN.})$, $tcwd \geq tcwd(\text{MIN.})$, $tawd \geq tawd(\text{MIN.})$ and $tcpwd \geq tcpwd(\text{MIN.})$, the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.
3. $\overline{WE}$: inactive (in read cycle)
 $\overline{CAS}$: inactive, $\overline{OE}$: active t_{CHO} is effective.
 $\overline{CAS}$, $\overline{OE}$: active t_{OCH} is effective.
4. $t_{OFC}(\text{MAX.})$, $t_{OFR}(\text{MAX.})$ and $t_{WEZ}(\text{MAX.})$ define the time when the output achieves the conditions of Hi-Z and is not referenced to V_{OH} or V_{OL} .
5. To make I/Os to Hi-Z in read cycle, it is necessary to control $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$ as follows. The effective specification depends on state of each signal.
 - (1) Both $\overline{RAS}$ and $\overline{CAS}$ are inactive (at the end of the read cycle)
 $\overline{WE}$: inactive, $\overline{OE}$: active
 t_{OFC} is effective when $\overline{RAS}$ is inactivated before $\overline{CAS}$ is inactivated.
 t_{OFR} is effective when $\overline{CAS}$ is inactivated before $\overline{RAS}$ is inactivated.
 The slower of t_{OFC} and t_{OFR} becomes effective.
 - (2) Both $\overline{RAS}$ and $\overline{CAS}$ are active or either $\overline{RAS}$ or $\overline{CAS}$ is active (in read cycle)
 $\overline{WE}$, $\overline{OE}$: inactive t_{WEZ} is effective.
 Both $\overline{RAS}$ and $\overline{CAS}$ are inactive or $\overline{RAS}$ is active and $\overline{CAS}$ is inactive (at the end of read cycle)
 $\overline{WE}$, $\overline{OE}$: active and either t_{RRH} or t_{RCH} must be met t_{WEZ} and t_{WPZ} are effective.
 The faster of t_{OZ} and t_{WEZ} becomes effective.
 The faster of (1) and (2) becomes effective.

Refresh Cycle

Parameter	Symbol	t _{RAC} = 50 ns		t _{RAC} = 60 ns		Unit	Note
		MIN.	MAX.	MIN.	MAX.		
$\overline{\text{CAS}}$ setup time	t _{CSR}	5	—	5	—	ns	
$\overline{\text{CAS}}$ hold time ($\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh)	t _{CHR}	10	—	10	—	ns	
$\overline{\text{RAS}}$ precharge $\overline{\text{CAS}}$ hold time	t _{RPC}	5	—	5	—	ns	
$\overline{\text{RAS}}$ pulse width ($\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh)	t _{RASS}	100	—	100	—	μs	1
$\overline{\text{RAS}}$ precharge time ($\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh)	t _{RPS}	90	—	110	—	ns	1
$\overline{\text{CAS}}$ hold time ($\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh)	t _{CHS}	−50	—	−50	—	ns	1
$\overline{\text{WE}}$ setup time	t _{WSR}	10	—	10	—	ns	
$\overline{\text{WE}}$ hold time	t _{WHR}	15	—	15	—	ns	

Note 1. This specification is applied only to the μPD42S65405.

Hyper Page Mode (EDO) Read Cycle ($\overline{\text{WE}}$ Control)

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Read Cycle ($\overline{\text{OE}}$ Control)

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

The diagram illustrates the timing relationships for a memory device. The signals shown are $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, Address, $\overline{\text{WE}}$, and I/O. The timing parameters are defined as follows:

- t_{RASP} : RAS pulse width
- t_{RHCP} : RAS hold time
- t_{RP} : RAS precharge time
- t_{CRP} : CAS to RAS precharge time
- t_{RCD} : RAS to CAS delay
- t_{CAS} : CAS pulse width
- t_{CP} : CAS precharge time
- t_{HPC} : High precharge time
- t_{RSH} : RAS to high precharge time
- t_{CPN} : CAS precharge to next pulse time
- t_{RAD} : Row address delay
- t_{ASR} : Address to RAS delay
- t_{RAH} : Row address hold time
- t_{ASC} : Address to CAS delay
- t_{CAH} : Column address hold time
- t_{AL} : Address to low time
- t_{WCS} : Write command to data strobe delay
- t_{WCH} : Write command to data hold time
- t_{DS} : Data strobe delay
- t_{DH} : Data hold time

2. In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Late Write Cycle

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Read Modify Write Cycle

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

★ **CAS Before RAS Self Refresh Cycle (Only for the μPD42S65405)**

Remark Address, $\overline{OE}$: Don't care I/O: Hi-Z

Cautions on Use of CAS Before RAS Self Refresh

CAS before RAS self refresh can be used independently when used in combination with distributed CAS before RAS long refresh; However, when used in combination with burst CAS before RAS long refresh or with long RAS only refresh (both distributed and burst), the following cautions must be observed.

(1) Normal Combined Use of CAS Before RAS Self Refresh and Burst CAS Before RAS Long Refresh

When CAS before RAS self refresh and burst CAS before RAS long refresh are used in combination, please perform CAS before RAS refresh 4,096 times within a 64 ms interval just before and after setting CAS before RAS self refresh.

(2) Normal Combined Use of CAS Before RAS Self Refresh and Long RAS Only Refresh

When CAS before RAS self refresh and RAS only refresh are used in combination, please perform RAS only refresh 4,096 times within a 64 ms interval just before and after setting CAS before RAS self refresh.

(3) If $t_{RAS(MIN.)}$ is not satisfied at the beginning of CAS before RAS self refresh cycles ($t_{RAS} < 100 \mu s$), CAS before RAS refresh cycles will be executed one time.

If $10 \mu s < t_{RAS} < 100 \mu s$, RAS precharge time for CAS before RAS self refresh (t_{RPS}) is applied.

And refresh cycles (4,096/128 ms) should be met.

For details, please refer to **How to use DRAM** User's Manual.

[MEMO]

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

[MEMO]

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
