

# DM54L42A/DM74L42A BCD/Decimal Decoders

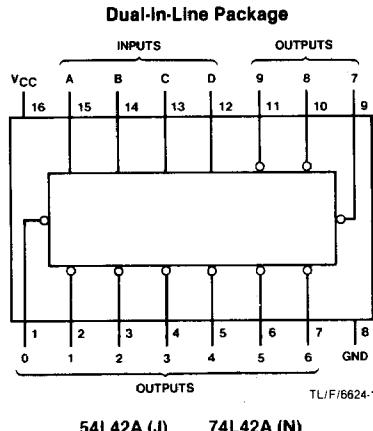

## General Description

These BCD-to-decimal decoders consist of eight inverters and ten, four-input NAND gates. The inverters are connected in pairs to make BCD input data available for decoding by the NAND gates. Full decoding of input logic ensures that all outputs remain off for all invalid (10-15) input conditions.

## Features

- Diode clamped inputs
- Also for application as 4-line-to-16-line decoders; 3-line-to-8-line decoders
- All outputs are high for invalid input conditions

## Connection Diagram

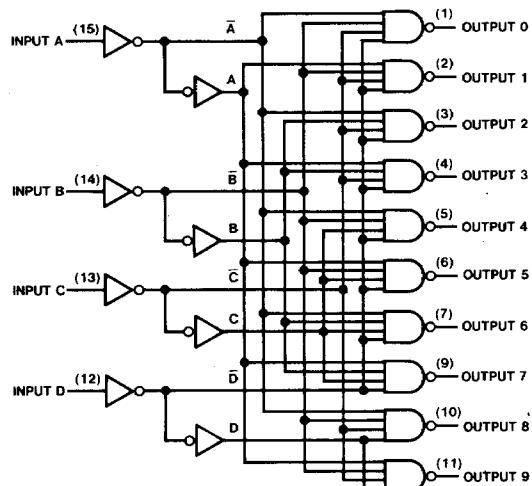

- Typical power dissipation 15 mW
- Typical propagation delay 53 ns

## Absolute Maximum Ratings (Note 1)

Supply Voltage	8V
Input Voltage	5.5V
Storage Temperature Range	-65°C to 150°C

**Note 1:** The "Absolute Maximum Ratings" are those values beyond which the safety of the device can not be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
