- (1) V_{TM} @ 2500A Peak for Z and ZD types; V_{TM} @ 500 A Peak for D, E, F, and G types; V_{TM} @ 5000 A Peak for J, JD
 (2) DC output Current using a type 62RLB assembly, ambient temperature = 50°C, air flow = 1000 LFM (5m/sec.)
 (3) DC output Current using a type 62HSW assembly, water temperature = 25°C, water flow = 1.0 GPM (.06 ltr/sec.)
 (4) AC RMS line Current using a type 22RLA assembly, ambient temperature = 50°C, air flow = 1000 LFM (5m/sec.)
 Higher output ratings are available using larger heatsinks, higher cooling flow rates, one in series with the cooling medium or lower ambient conditions.

Except Z, ZD Types are in a 11 XM
 Type air cooled heatsink and J, JD
 Types are in special heatsinks.

PLEASE NOTE: The above summary is only a convenient introduction to the PSI thyristor family. Much more detail is available from the factory on:
 • Paralleling characteristics • Special dv/dt to 1000 V/ μsec • Reverse recovery characteristics • Welding characteristics
 Please contact the factory or your nearest PSI representatives for more details.

(5) $V_s \leq 1000V$, $I_{TM} \geq 2 \times I_{T(AV)}$, $T_J = 125^\circ C$, Rep Rate 60 Hz, Gate Drive - see below*(6) @ Max. T_J , to 80% of rated V_{DRM} , (linear)(7) $T_J = 125^\circ C$, $I_{TM} = 500A$, $V_R \geq 50V$, $di/dt = -10A/\mu s$, Reapplied Volt. - linear to V_{DRM}

(8) Caution: This could cause triggering and is not recommended

(9) $T_J = 25^\circ C$ $V_D = 9V$ (10) Derate V_{DRM} , V_{RRM} , 10% for Operation below $0^\circ C$.*Standard Gate Drive: Open Circuit Voltage = 20V, Source Impedance = 10 ohms, Pulse width = 10 μs , Rise Time $\leq .2 \mu s$

STANDARD OPTIONS

The P S I devices specified herein are based on standard devices that have proven most successful in service. Certain options have proven very valuable and are available on most P S I pressure mounted thyristors on special order.

1. Differential Voltage Ratings

On standard devices the voltage rating is determined by the lowest reading of five voltages, i.e. V_{DRM} , V_{RRM} @25°C and at 125°C, plus dv/dt . However, there are applications and circuits that place widely different requirements on V_{DRM} , V_{RRM} and dv/dt . Savings can often be realized on such units as shown below:

PRICE RATIO	
A. F400-12	1.0
B. F400-18	1.5
C. F400-12/15/18	1.2

Thyristor A and B are measured by the standard method, while unit C offers V_{RRM} of 1800V, V_{DRM} of 1500V and dv/dt of 100V/usec at 1200V. Thus, the vital V_{RRM} is available at less cost than if all criteria had to be met.

This option is particularly valuable on certain D.C. bridge applications where V_{DRM} and dv/dt are not quite as important as V_{RRM} .

2. Suppression Rating

This refers to the ability of a thyristor to block voltage in the forward direction immediately following surge current. This property is particularly important on protective systems known as "ride through", whereby the equipment phases back to a safe value immediately following a current overload.*

FIG. 1 illustrates this property and a typical specification would read as follows: "from a starting T_j of 100°C device must block V_{DRM} of 1800 volts 4 milliseconds following 16000 amp surge."

For more complete characterization of this property it is necessary that the user supply the following information:

- Junction temperature prior to surge
- Magnitude and duration of surge
- Magnitude of reapplied voltage
- Interval between surge and reapplied voltage

*For more details refer to IEEE paper available from P S I.

P S I POWER PACKAGE ASSEMBLIES

T-01-01
T-25-01

As the first power semiconductor manufacturer to switch completely to pressure mounted devices, P S I was forced to develop hardware and cooling systems before most other suppliers. With the introduction of the 52mm ASTRO-PACK, the 76mm and 102mm units, we had to update this work to mount and cool devices approximately 2.5 times larger than those in general use.

You will see many examples of our results on the next pages, but please remember that all such designs are available to users of P S I semiconductors. P S I has no vested interest in assemblies themselves and will gladly share the details of any standard unit you see on the next page.

(Obviously the custom assemblies we build for many clients remain their exclusive property).

With this thought in mind many customers turn to P S I standard Power Packages for prototype and low volume production, building their own with P S I assistance if ultimate volume warrants. By using common parts they can take advantage of P S I inventories to supplement their own or for emergency service.

Others prefer to let P S I handle the "whole job" in view of the fact that they have enough details to worry about without the following:

What it requires to assemble a Power Package:

Six steps times nine materials versus the P S I Power Package customer who simply purchases a proven assembly.

How to find the best Power Package for your job.

1. First determine the necessary circuit configuration i.e. A.C. switch, D.C. bridge, star or double wye — single or three phase., e.g. controlling a 100 H.P. A.C. motor requires an A.C. switch.
2. Then, the necessary current to be rectified or controlled, under the most severe possible conditions of temperature, conduction angle, coolant flow, overloads, etc., e.g., continuous line current is 220 amps RMS.
3. What type of cooling is available and desirable. Liquid cooling of course is most effective, then forced air or free convection.

Basic reliability runs in the reverse order, with free convection ideal for relatively light loads and liquid cooling requiring the most attention to many details, e.g. forced air is permissible for our starter example.

4. You can then aim for basic areas from the load current listing on pages 2 and 3. These give close approximations of current available from various P S I devices, using the most popular cooling scheme, heatsinks and flow. e.g. this corresponds to the F-500, on an RL heatsink. We then turn to pages 17A - 17L for more details.

T-25-01

ASSEMBLY ORDERING CODE

A typical basic part number would be as follows:

Code No. —	1	2	3	4	5	6	7	8	
PSI —	6	2	RL	A	F	03	08	SAA	example

Code No.

1. Number of devices in assembly.

2. Number of devices in series with cooling flow.

3. Type of Heatsink:

UL	6" U-Channel	(for F and G Types)
WM	4.5" Medium	(for F and G Types)
RL	6" Type 42	(for F, G, and Z Types)
RX	6" Type 42 Copper	(for F, G, and Z Types)
WL	7.5" Large	(for F, G, and Z Types)
AS	6" Astrosink	(for F, G, and Z Types)
XM		(for Z and J Types)
HS	Water Cooled	(for F, G, and Z Types)
HL	Water Cooled	(for J and K Types)

example above

(6 devices)

(2 devices)

(RL Type 42)

4. Type of Circuit:

A	— AC switch	
B	— Bridge	
S	— Star	
W	— Double Wye	} cathodes common
P	— Parallel	

(AC Switch)

5. Device Family:

F	— Power Pack	28mm	SCR
G	— Mega Pack	33mm	SCR
H	— Astro Pack	52mm	SCR
D	— Diode	all diodes	
J	— J Pack	76mm	SCR
K	— K Pack	102mm	SCR

(F Pack)

6. Type of Device:

Device part number divided by 100

example Z 1000 → 10 G850 → 08

(F300)

7. Voltage rating of device divided by 100

example 1000V → 10 800V → 08

(800V)

8. Suffix Letters:

SAA	— SCR or Diode Assembly	Hybrid Circuit
SAB	— Mounting tabs, "Fast Access"	SBA — Mounting tabs
SAC	— Tabs and fan, "Fast Access"	SBB — Tabs and fan
SAD	— Tabs and 2 fans, "Fast Access"	SBC — Tabs and 2 fans
SAE	— Phenolic mounting rails	SBD — Phenolic mounting rails
SAF	— No mounting rails	SBE — No mounting rails
		SBF — Phenolic mounting rails and 2 fans

(Mounting Tabs)

example 3 phase 6 SCR Bridge, 2 in series with airflow in a type 42 Heatsink
using Z1000-12 with "Fast Access" feature

answer 62RLB Z10-12 SAA

THE ASSEMBLIES ARE SHOWN BELOW WITH OPTIONAL PHENOLIC MOUNTING RAILS:

TYPE U

TYPE RL

TYPE WM

TYPE WL

Note: Types AS, XM come in single heatsinks only. Types HS come in single (11HS), double (22HS) or triple (33HS) only.
Types UL, WM, RL, WL, are available in 63 or 33 — assemblies (3 in series with air flow).

"Fast Access" Power Packages

T-01-01

T-25-01

Another example of P S I leadership is the introduction of a complete line of "Fast Access" heatsinks and mounting hardware.

This equipment makes possible inspection and/or replacement of a thyristor or diode in less than a minute. Several types are available. The V.I.P. package (FIG. A) features a complete assembly, with or without cabinet for either D C bridge or A C switch service.

A more flexible arrangement is shown in FIG. B whereby universal mounting feet are added to several types of heatsinks (RL, WM and WL). These mounting feet are bolted to various electrical and mechanical mounting accessories and can be easily removed.

Standoff insulators can be used or extruded insulating channel with or without a complete bus system as shown in FIG. C. The advantage of this system is simplicity of design, low cost and low tooling cost should you care to make your own.

Note that the feet themselves add 1½" (44.5mm.) length to each end, while the extruded insulating channel or bus system adds another 1½" (44.5mm.) to each end for a total of 7" (178mm.) overall.

If integral fans are desired, another 2" (51 mm) is added for each. The two fan system shown in (FIG. B) is particularly popular for reliability considerations, as the assembly is sized to operate with just one fan functioning.

Fast access has proven to be a most effective selling tool for the progressive control manufacturer, particularly when used with the new "fuseless" design philosophies so popular in drives and electro-chemical supplies.

FIG. A

FIG. B

FIG. C

The Type "AS" Astrosink

Shown in FIG. D the ASTROSINK is a specialized shape used primarily for upgrading of a very popular European semiconductor. Originally designed for 28 mm and 33 mm wafers, the ASTROSINK can now accommodate the 52 mm ASTROPACK and thus offer present users the chance to upgrade their design for more surge capability, continuous current or both.

While only slightly better than the RL type heatsink in terms of thermal efficiency the ASTROSINK has also gained acceptance as a sturdy work horse on which pressure mounted or stud type semiconductors can be mounted, with the convenient mounting tabs offering simple connection to buswork. Available in 6" lengths as standard the thermal impedance figures are given in FIG. E.

Convert-a-Pack

While the industry has rapidly switched from stud to pressure mounted semiconductors, many customers wish to upgrade existing controls using stud type heatsinks to take advantage of pressure mount without a major redesign.

The P S I Convert-a-Pack answers this need (FIG. F), with special mounting hardware and auxiliary heatsinks fitting inside of existing extrusions and bus connections. Each Convert-a-Pack is specifically designed by P.S.I. for individual objectives. They offer the control manufacturer the fastest method of enjoying most of the advantages of pressure mounted units.

MOUNTING INSTRUCTIONS

The contact faces of the heat sink should be kept clean and should be flat to within .001"/" T.I.R. The contact pedestals of the POWER PACK should be treated carefully as they are copper and easily damaged. We recommend the use of Penetrox "A" available from Burndy Corporation as heat sink compound. For proper use of this material, contact the factory.

Assembly drawings of the PSI clamps are shown below. The force applied to the heat sinks is controlled by the number of turns made on the bolts. The bolts are first tightened "finger" tight (10 inch-lbs.) using a torque indicating device.

The drawings show the number of turns and the tightening sequence for a range of forces between 500 kg. (1,100 lb.) and 2000 kg. (4,400 lb.) This method of assembly will insure that the force applied to the device will be within $\pm 20\%$ of the specified value and that the thermal impedance (junction to heat sink) will not exceed the value specified on the spec. sheets of the individual devices. Bolts should be tightened in quarter turn increments.

The J-Pack clamp tightening sequence is 5 ft-lbs. followed by 1-1/4 turns. See Figure on page 19.

ASSEMBLY ORDER

1. Bolt
2. Two steel washers
3. Aluminum washer
4. Insulator
5. Aluminum washer
6. One Spring Bar
7. Heat sinks and device
8. One Spring Bar
9. Nut Holder

THESE ARE TEMPLATES FOR THE MOST POPULAR SIZES OF SCR'S. JUST PLACE YOUR PART ON THE TEMPLATE AND IDENTIFY WHICH SERIES YOU HAVE. WITH THIS INFORMATION PLUS THE VOLTAGE AND HORSEPOWER RATING OF THE SYSTEM IN WHICH IT IS INSTALLED. WE CAN THEN DO A CROSS REFERENCE.
