

## 100328 Low Power Octal ECL/TTL Bi-Directional Translator with Latch

### General Description

The 100328 is an octal latched bi-directional translator designed to convert TTL logic levels to 100K ECL logic levels and vice versa. The direction of this translation is determined by the DIR input. A LOW on the output enable input (OE) holds the ECL outputs in a cut-off state and the TTL outputs at a high impedance level. A HIGH on the latch enable input (LE) latches the data at both inputs even though only one output is enabled at the time. A LOW on LE makes the 100328 transparent.

The cut-off state is designed to be more negative than a normal ECL LOW level. This allows the output emitter-followers to turn off when the termination supply is  $-2.0V$ , presenting a high impedance to the data bus. This high impedance reduces termination power and prevents loss of low state noise margin when several loads share the bus.

The 100328 is designed with FAST® TTL output buffers, featuring optimal DC drive and capable of quickly charging and discharging highly capacitive loads. All inputs have  $50\text{ k}\Omega$  pull-down resistors.

### Features

- Identical performance to the 100128 at 50% of the supply current
- Bi-directional translation
- 2000V ESD protection
- Latched outputs
- FAST® TTL outputs
- TRI-STATE® outputs
- Voltage compensated operating range =  $-4.2V$  to  $-5.7V$
- Available to industrial grade temperature range
- Available to MIL-STD-883

**Ordering Code:** See Section 6

### Logic Symbol

TL/F/10219-1

| Pin Names                      | Description             |
|--------------------------------|-------------------------|
| E <sub>0</sub> -E <sub>7</sub> | ECL Data I/O            |
| T <sub>0</sub> -T <sub>7</sub> | TTL Data I/O            |
| OE                             | Output Enable Input     |
| LE                             | Latch Enable Input      |
| DIR                            | Direction Control Input |

All pins function at 100K ECL levels except for T<sub>0</sub>-T<sub>7</sub>.

### Truth Table

| OE | DIR | LE | ECL Port      | TTL Port | Notes |
|----|-----|----|---------------|----------|-------|
| L  | X   | L  | LOW (Cut-Off) | Z        |       |
| L  | L   | H  | Input         | Z        | 1, 3  |
| L  | H   | H  | LOW (Cut-Off) | Input    | 2, 3  |
| H  | L   | L  | L             | L        | 1, 4  |
| H  | L   | L  | H             | H        | 1, 4  |
| H  | L   | H  | X             | Latched  | 1, 3  |
| H  | H   | L  | L             | L        | 2, 4  |
| H  | H   | L  | H             | H        | 2, 4  |
| H  | H   | H  | Latched       | X        | 2, 3  |

H = HIGH Voltage Level  
 L = LOW Voltage Level  
 X = Don't Care  
 Z = High Impedance

- Note 1: ECL input to TTL output mode.
- Note 2: TTL input to ECL output mode.
- Note 3: Retains data present before LE set HIGH.
- Note 4: Latch is transparent.

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

|  |                   |
|--|-------------------|
| Storage Temperature ( $T_{STG}$ )      | -65°C to +150°C   |
| Maximum Junction Temperature ( $T_J$ ) |                   |
| Ceramic                                | +175°C            |
| Plastic                                | +150°C            |
| $V_{EE}$ Pin Potential to Ground Pin   | -7.0V to +0.5V    |
| $V_{TTL}$ Pin Potential to Ground Pin  | -0.5V to +6.0V    |
| ECL Input Voltage (DC)                 | $V_{EE}$ to +0.5V |
| ECL Output Current (DC Output HIGH)    | -50 mA            |
| TTL Input Voltage (Note 3)             | -0.5V to +6.0V    |
| TTL Input Current (Note 3)             | -30 mA to +5.0 mA |

**Note 1:** Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** ESD testing conforms to MIL-STD-883, Method 3015.

**Note 3:** Either voltage limit or current limit is sufficient to protect inputs.

Voltage Applied to Output in HIGH State

TRI-STATE Output -0.5V to +5.5V

Current Applied to TTL

Output in LOW State (Max) Twice the Rated  $I_{OL}$  (mA)

ESD (Note 2)

≥2000V

## Recommended Operating Conditions

Case Temperature ( $T_C$ )

Commercial

0°C to +85°C

Industrial

-40°C to +85°C

Military

-55°C to +125°C

ECL Supply Voltage ( $V_{EE}$ )

-5.7V to -4.2V

TTL Supply Voltage ( $V_{TTL}$ )

+4.5V to +5.5V

## Commercial Version

### TTL-to-ECL DC Electrical Characteristics

$V_{EE} = -4.2V$  to  $-5.7V$ ,  $V_{CC} = V_{CCA} = GND$ ,  $T_C = 0°C$  to  $+85°C$ ,  $V_{TTL} = +4.5V$  to  $+5.5V$  (Note 4)

**Note 4:** The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

**Note 1:** Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH to LOW ( $t_{OSHL}$ ), or LOW to HIGH ( $t_{OSLH}$ ), or in opposite directions both HL and LH ( $t_{OST}$ ). Parameters  $t_{OST}$  and  $t_{ps}$  guaranteed by design.

**Note:** The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

**Note 1:** F100K 300 Series cold temperature testing is performed by temperature soaking (to guarantee junction temperature equals  $-55^\circ C$ ), then testing immediately without allowing for the junction temperature to stabilize due to heat dissipation after power-up. This provides "cold start" specs which can be considered a worst case condition at cold temperatures.

**Note 2:** Screen tested 100% on each device at  $-55^\circ C$ ,  $+25^\circ C$ , and  $+125^\circ C$ , Subgroups, 1, 2, 3, 7, and 8.

**Note 3:** Sample tested (Method 5005, Table I) on each manufactured lot at  $-55^\circ C$ ,  $+25^\circ C$ , and  $+125^\circ C$ , Subgroups A1, 2, 3, 7, and 8.

**Note 4:** Guaranteed by applying specified input condition and testing  $V_{OH}/V_{OL}$ .

**Note 1:** F100K 300 Series cold temperature testing is performed by temperature soaking (to guarantee junction temperature equals  $-55^\circ C$ ), then testing immediately after power-up. This provides "cold start" specs which can be considered a worst case condition at cold temperatures.

**Note 2:** Screen tested 100% on each device at  $+25^\circ C$ , temperature only, Subgroup A9.

**Note 3:** Sample tested (Method 5005, Table I) on each mfg. lot at  $+25^\circ C$ , Subgroup A9, and at  $+125^\circ C$  and  $-55^\circ C$  temperatures, Subgroups A10 and A11.

**Note 4:** Not tested at  $+25^\circ C$ ,  $+125^\circ C$  and  $-55^\circ C$  temperature (design characterization data).

### Test Circuitry (TTL-to-ECL)

TL/F/10219-7

- Note 1:**  $R_t = 50\Omega$  termination. When an input or output is being monitored by a scope,  $R_t$  is supplied by the scope's  $50\Omega$  resistance. When an input or output is not being monitored, an external  $50\Omega$  resistance must be applied to serve as  $R_t$ .
- Note 2:** TTL and ECL force signals are brought to the DUT via  $50\Omega$  coax lines.
- Note 3:**  $V_{TTL}$  is decoupled to ground with  $0.1\ \mu\text{F}$  to ground,  $V_{EE}$  is decoupled to ground with  $0.01\ \mu\text{F}$  and  $V_{CC}$  is connected to ground.
- Note 4:** For ECL input pins, the equivalent force/sense circuitry is optional.

## Test Circuitry (ECL-to-TTL)

TL/F/10219-10

**Note 1:**  $R_T = 50\Omega$  termination. When an input or output is being monitored by a scope,  $R_T$  is supplied by the scope's  $50\Omega$  resistance. When an input or output is not being monitored, an external  $50\Omega$  resistance must be applied to serve as  $R_T$ .

**Note 2:** The TTL Tri-State pull up switch is connected to +7V only for ZL and LZ tests.

**Note 3:** TTL and ECL force signals are brought to the DUT via  $50\Omega$  coax lines.

**Note 4:**  $V_{TTL}$  is decoupled to ground with  $0.1\ \mu\text{F}$ .  $V_{EE}$  is decoupled to ground with  $0.01\ \mu\text{F}$  and  $V_{CC}$  is connected to ground.
