TOSHIBA HYBRID DIGITAL INTEGRATED CIRCUIT

67,108,864-WORD BY 72-BIT SYNCHRONOUS DRAM MODULE

DESCRIPTION

The THMY7264G0LEG is a 67,108,864-word by 72-bit synchronous dynamic RAM module consisting of 36 TC59SM704FT DRAMs and PLL/Registers on a printed circuit board.

FEATURES

- 67,108,864-word by 72-bit (double-bank) organization
- Single power supply of 3.3 V ± 0.3 V
- Pipeline architecture
- Auto-refresh and Self-refresh capability
- All inputs and outputs LVTTTL-compatible
- 4096 refresh cycles per 64 ms
- Package: 168-pin DIMM Gold contacts
- Based on RCC PC133 Rev. 1.0 (-75)
- Based on Intel PC100 Rev. 1.2 (-80)

		-75	-80
t _{CK}	Clock Cycle Time (DIMM CL = 4)	7.5 ns	8 ns
t _{RAS}	Active-to-Precharge Command Period (min)	45 ns	48 ns
t _{AC}	Access Time from CLK (DIMM CL = 4)	5.4 ns	6 ns
t _{RC}	Ref/Active-to-Ref/Active Command Period (min)	65 ns	68 ns

PIN ASSIGNMENT (TOP VIEW)

PIN NAMES

A0 to A11	Address Inputs
BA0, 1	Bank Select
DQ0 to DQ63	Data Inputs/Outputs
CB0 to 7	Check Bits
/CS0 to 3	Chip Select
/RAS	Row Address Strobe
/CAS	Column Address Strobe
/WE	Write Enable
DQMB0 to 7	Output Disable/Write Mask
CLK0 to 3	Clock Input
CKE	Clock Enable
REGE	Register Enable
SDA	Serial Data/Address for PD
SCL	Clock for PD
SA0 to 2	Address for PD
WP	Write Protect for PD
VDD	Power (+ 3.3 V)

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

t_{RSC}	Mode Register Set Cycle Time	15		16		ns	9	

* CL is \overline{CAS} latency. (DIMM Level)

NOTES

1. Conditions outside the limits listed under Absolute Maximum Ratings may cause permanent damage to the device.
2. All voltages are referenced to Vss.
3. These parameters depend on the cycle rate and their values are measured at the minimum cycle rate value t_{CK} and t_{RC} . Input signals are changed once during t_{CK} .
4. These parameters depend on the output loading. The specified values are obtained with the output open.
5. These values are measured under the following conditions.
 - A Front (or Back) side : Under the measuring conditions given on the date sheet
Back (or Front) side : In standby (measured under the I_{CC2} conditions)
 - B Address, BA, \overline{RAS} , \overline{CAS} and \overline{WE} are fixed High level, and DQMB is fixed Low level.
 - C After bank Active, Address, BA, \overline{RAS} , \overline{CAS} and \overline{WE} are fixed High level, and DQMB is fixed Low level.
 - D Under self refresh, CLK is fixed Low level, and Address, BA, \overline{RAS} , \overline{CAS} and \overline{WE} are fixed High level, and DQMB is fixed Low level.
6. The power-up sequence is described in Note 12.

7. AC TEST CONDITIONS

Reference Level of Output Signals	1.4 V / 1.4 V
Output Load	See the diagram for AC Test Load (B) below
Input Signal Levels	2.4 V / 0.4 V
Transition Time (Rise and Fall) of Input Signals	2 ns
Reference Level of Input Signals	1.4 V

8. Transition times are measured between the V_{IH} and V_{IL} levels. The transition (rise and fall) of input signals has a fixed slope.
9. t_{HZ} defines the time at which the outputs go open circuit and are not reference levels.

10. These parameters depend on the number of clock cycles and depend on the operating frequency of the clock as follows:

$$\text{Number of clock cycles} = \text{Specified value of timing} / \text{Clock period}$$

(Round up fractions to a whole number.)

11. t_{CH} is the pulse width of CLK measured from the positive edge to the negative edge and referenced to V_{IH} (min). t_{CL} is the pulse width of CLK measured from the negative edge to the positive edge and referenced to V_{IL} (max).

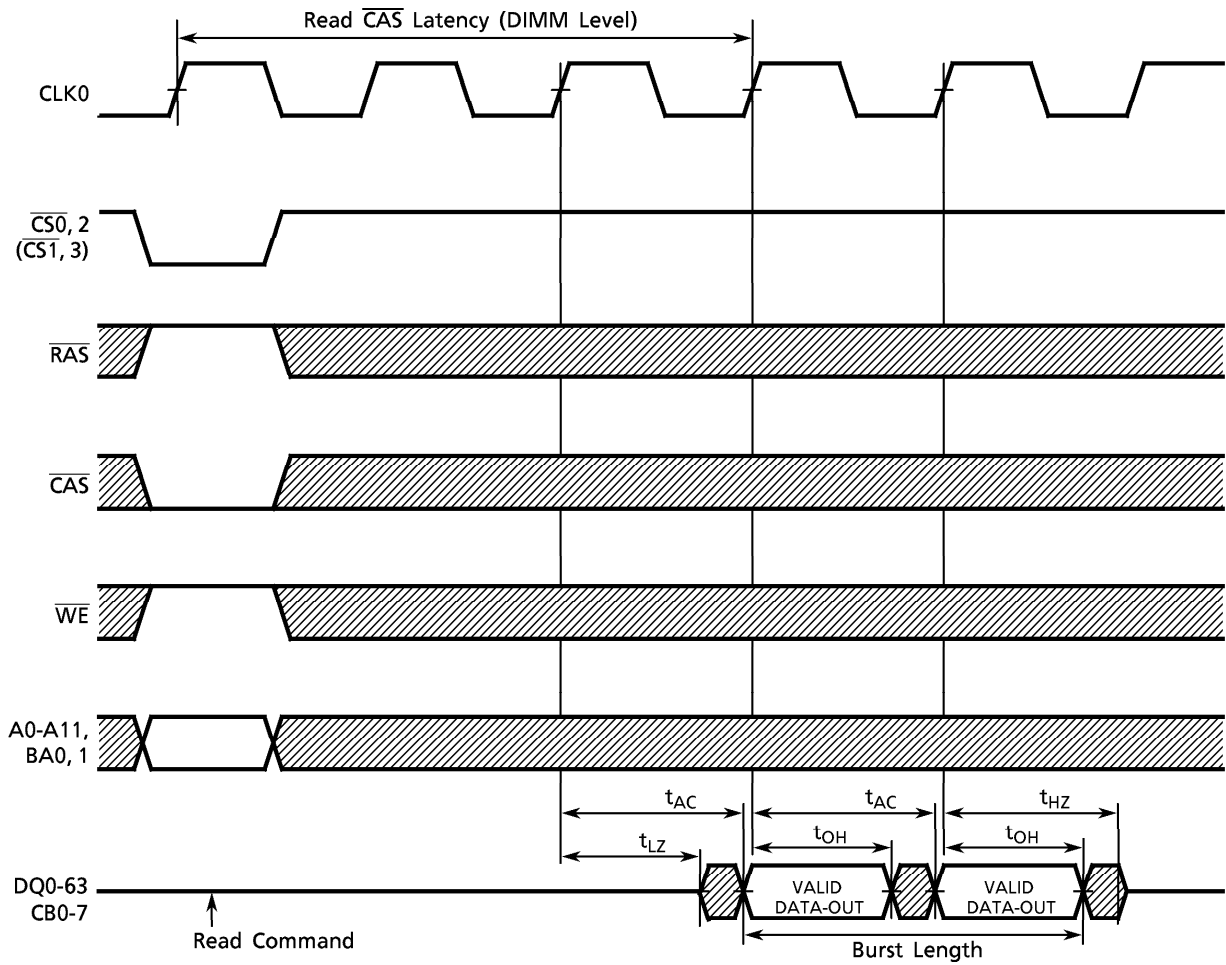

12. Power-up Sequence

Power-up must be performed in the following sequence.

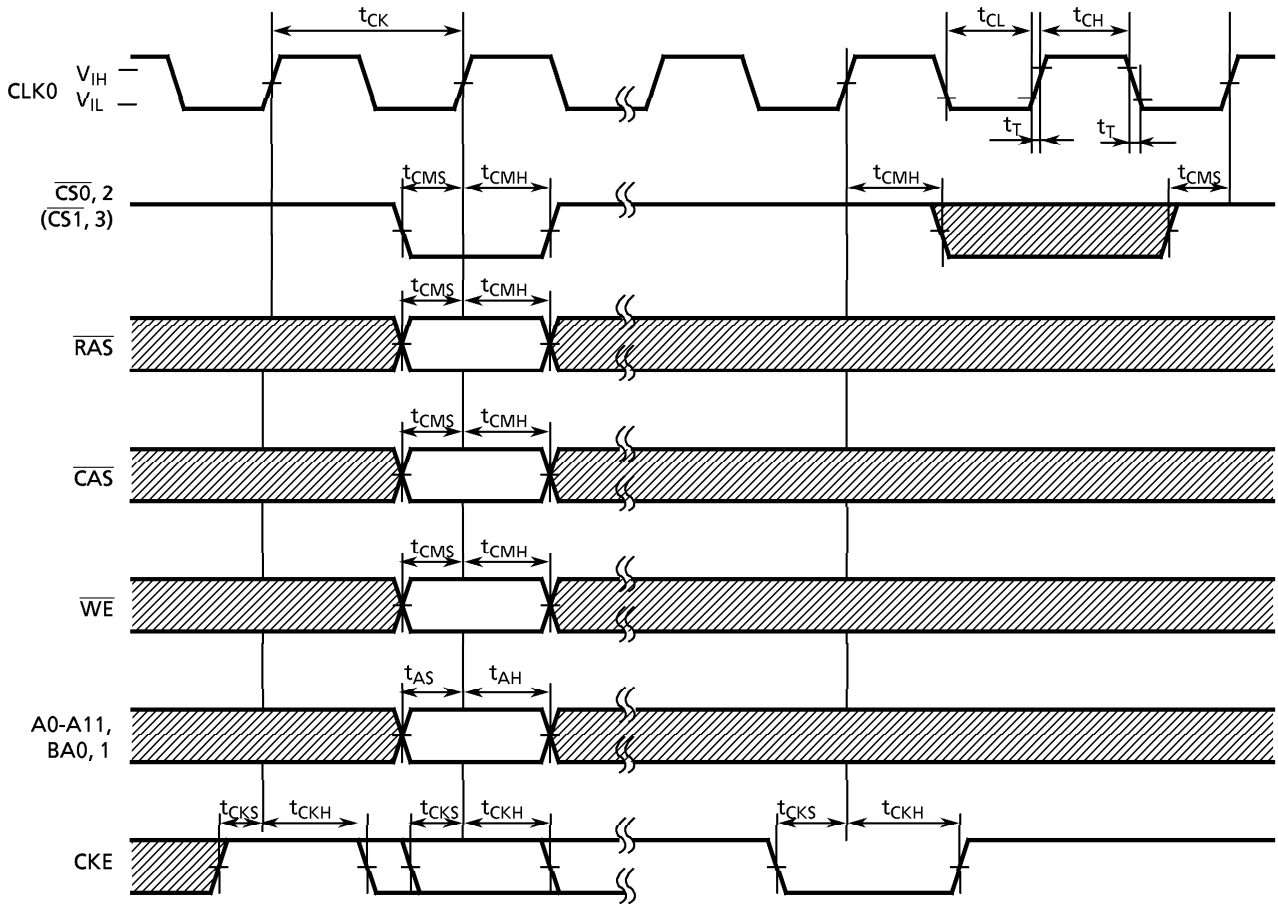

- 1) Power must be applied to V_{DD} with all input signals held in the NOP state. The CLK signal must be started at the same time as power is applied.
- 2) After power-up a pause of at least 200 μ seconds is required. Then, DQMB and CKE must be held High (at the V_{DD} level) to ensure that the DQ and CB outputs are high-impedance.
- 3) Both banks must be precharged.
- 4) The Mode Register Set command must be asserted to initialize the Mode register.
- 5) An Auto-Refresh operation must consist of at least eight Auto-Refresh cycles.
The order in which 4) and 5) are performed is interchangeable.
