74VHC9363FT,74VHC9364FT

1. Functional Description

・ Dual 3-bit Schmitt trigger Buffer

74VHC9363FT:With pull-down resistor at data input terminal

74VHC9364FT:With pull-up resistor at data input terminal

2. General

The 74VHC9363, 74VHC9364 are an advanced high speed CMOS Hex SCHMITT BUFFERs fabricated with silicon gate C^2MOS technology.

These are fit for use interface between microcomputer to IPU (Integrated Power Unit) at the three-phase inverter circuit, because it consists of two of 3-bit schmitt trigger buffer circuits which is controlled by three of control Inputs / Gxn(s).

Since outputs level can be fixed "L" level for 74VHC9363 and "H" level for 74VHC9364 when to disabling of output terminal with the control input which received the fail signal, it compared with the pull-down / pull-up resistor normally used, it is less affected by ambient noise and contributes to the improvement of motor operation control accuracy of IPU (Integrated Power Unit).

Each data input terminal Dxn and control terminal / Gxn has a built-in pull-up resistor or pull-down resistor, it's can fixed output level even when the input is open.

・Description of terminal name: "x" is H or L, N is 1 to 3.

Supply voltage	V_{CC}		-0.5 to 7.0	V
Input voltage	V_{IN}		-0.5 to 7.0	V
Output voltage	V_{OUT}		-0.5 to V_{CC} + 0.5	V

Storage temperature	T_{stg}		-65 to 150	°C

Note: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.
Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook (“Handling Precautions”/“Derating Concept and Methods”) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 1: 180 mW in the range of T_a = -40 to 85 °C. From T_a = 85 to 125 °C a derating factor of -3.25 mW/°C shall be applied until 50 mW.

10. Operating Ranges (Note)

Characteristics	Symbol	Rating	Unit
Supply voltage	V_{CC}	2.0 to 5.5	V
Input voltage	V_{IN}	0 to 5.5	V
Output voltage	V_{OUT}	0 to V_{CC}	V
Operating temperature	T_{opr}	-40 to 125	°C

Note: The operating ranges must be maintained to ensure the normal operation of the device.
Unused inputs must be tied to either V_{CC} or GND.

Note: All input terminal has a built-in pull-up resistor or pull-down resistor.
It is recommended that unused inputs be connected to V_{CC} or GND.
